FamilyNet International Newsgate

   This is a message saying I have Warerat's CX802 512K XE upgrade running in my Atari 800. Currently running Ice-T XE. :D

   This is a proud moment for Atari 8-bit history, and certainly hoping not the end of the upgraded Atari 800's (beige line, yes) ;)

   Smiles everyone... smiles... :)

   Doctor Clu
   (Entered on a Atari 800+)

I like my 130XE *pout* :)

But i also have a 800xl   (and an ST .. never could afford a falcon or
stacy at the time.. now the are scarce around here..)

Has anyone taken a recent look at all of the "missing" APX titles at
http://www.atariarchives.org/APX/

I'm specifically referring to the significant number shown as "we have
permission, but we need a copy of the software." There are quite a few
utilities listed that I would think someone has in their collections.
 I've donated what I have, but there are quite a few more that are
unlocated.

And perhaps someone has an idea as to contacting a "missing" author?
Unfortunately, some are probably no longer with us, but perhaps someone
may know a couple of these folks.

Thanks,
Larry

Oops misread that.. :)

Anyway just got a 130XE and two 1050's really cheap on eBay. I was
after an 800XL but that was too good of a deal to pass up.

Now to figure out the best car, flight and space games... :)

Thanks,

Tom

Pole Position, Pitstop, Great American cross country road race, New york
City, F-15 strike eagle, Spitfire ace, Defender, Star Raiders, The Last
Starfighter........ Oh and get Alternate Reality. Be careful though it

is addictive.

The 130XE is the better unit. The extra ram disk is most useful.

Mark

The simplest way, as far as I know, would be to make a cable that has a
1/8" stereo jack, with both left and right signals tied together and
going to the Audio In (pin 11 on the SIO port). You could make that
with the 1/8" stereo plug and go direct to the line out on a PC/Mac,
but I prefer using a jack to keep the cable short and using a patch
cord to link the 2 units.

Oooh! Much cool; is that totally XL/XE compatible?
Outstanding use of the best 8-bit ever...

Congrats,
-Jess

Bobterm uses the color monitor and the mono monitor for the XEP80.
Just FYI.

I've just found the following from the BobTerm documentation. It does use
both at the same time! I forgot all about that. BobTerm had it's own XEP80
driver, I believe.

XEP80.BTM

> This is a driver for the XEP-80 80 column box from Atari. The
> driver directs ONLY the term mode screen to both the XEP and the standard

> scrolling in one window and not in another. This is unfortunate.

In any event, you will need two monitors <or a switch for your monitor> to see the term mode screen on the XEP, and the help/editing screens on your computer's output. The XEP driver will update both screen simultaneously, without blanking the computer's screen. Have your XEP-80 plugged into joystick port #2!

Hi Tom,

I came down the exact same road as you, and my research and help pointed
to an Atari 800XL with an SIO2PC cable as the best all-around setup.

Thanks for your reply.

I am curious about the Atari 800 though. It has two cartridge ports,
plus additional expansion bays above the cartridge ports. Will I be
missing something by only having one cartridge port?

What is the Parrelel Bus and IO port good for?

Thanks,

Tom

The 800 didn't have BASIC integrated into it, so you could leave that
cart in all the time. You don't miss anything not having two ports that
I've ever heard of.

The expansion slots stored 16k of ram each for a total of 64k (16k is
built in) which is also standard on the 800XL.   The only thing you
really miss is that the original 800 had 4 joystick ports and nothing
else has that, so if the few 4 player games interest you, then the 800
is the only way.

Good luck!

The 800 had a max on stock RAM cards at 3 x 16K for 48K; there
were some
mods that took it up to 1088K and probably beyond... There were
also some
8K and even 32K cards; BUT still a max of 48K accessable unless
you use a
bank switch method.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

I had a question about the XEP-80 related to system performance and was
wondering if anyone here knows the answer.

Turning off the Antic chip in a 8-bit Atari causes a significant increase in
performance since it is no longer interrupting the 6502. Since the XEP-80
is an external device, I would assume there is no need for Antic to be
turned on while it is in use.

Does the XEP-80 driver by default turn off the Antic chip when it is
enabled? If so, what type of computing performance increases would you
expect while using the XEP-80? (Obviously the display is slower than is
possible with memory mapped video, but that is another issue).

Jason Harmon

Some people get a 400 or 800 just for playing Mule because it has 4 joystick ports. It's a good machine but kind of bulky. Expansions like memory or hard drive are hard to find. It is a sweet machine for the time it came out, 1979: Nice keyboard, decent video output. BTW: As someone has said, get a SIO2PC cable and it will work with an 800.

There were not a lot of carts that used the extra slot. Actually the functionality of the 2nd cartridge port was built into the single cartridge port of the later models.

>
> What is the Parrelel Bus and IO port good for?

Unless you want to become a power user or hacker, not much. There's some expensive expansion boxes for memory/floppy/RS232/Hard Drive type stuff.

You may want to consider a 130XE. You really need 48k of memory in your 800 to be able to use DOS. A 130XE has 128k built in and is compatible/can be made even more compatible by loading an 800 OS from disk. I have a collection of various Atari 8 bits but if I were to pick the essentials to own they would probably be an 800 and a 130XE. It's not that they were the best, just that they represent the alpha/omega of Atari 8 bits.

Well what I'm worried about now is that I've seen some gams that look
interesting at some websites but are labeled as Atari XE. If I got an
800XL I would not be able to run those right? I havent seen any
devices that use the expension interfaces of either XL or XE so dont
know if that matters as a deciding factor.

Right now it's 800XL vs 130XE for me now..

Thanks,

Tom

Lukasz, thanks for the information. The game seems cool and I look
forward to download it to my K700i mobile phone.

The Atari version too looks interesting. Did you disassemble the
Atari code to find out about details in the game logic?

Anders

What I'm referring to is:
http://www.atari-shop.nl/xlxe400800.htm

There are games there marked XE. Will those run in a 800XL?

Thanks,

Tom

I have some dysan DSDD disks in sealed hard plastic case, in sets of 10
cases with 10 disks each for 100 disks total. If anyone is interested they
are $20 for the 100 in hard cases of 10 each, price will include media mail
shipping the whole box is a bit heavy.

Let me know if you want any, these have been stored in ac storage and I've
used them myself with some astra 2001 drives which are true double density
and they work flawlessy.

I rather not list on ebay so let me know asap if anyone is interested $20
shipped per box of 10 hard cases total of 100 sealed new disks. The hard
cases also elminate your disk storage problems.

The XE on the label was probably to keep people from getting confused
since the XE was the current one being manufactured. In truth I think
most of those games probably will even run on an 800.

The 800XL is a good machine and probably the most hacked of Atari
computers. Stuff like alternate OS and 256k memory expansion is around.

There are quite a few programs, including almost all versions of SpartaDOS,
that will not run on a unhacked Atari 800.

Well I'm also hearing the XE is poorly made here in the newsgroup...

So I've decided to go with 800XL w/ 1050. Anyone know of good places
to look besides eBay? Anyone have any for sale?

Thanks,

Tom

Is there anywhere to get a SIO2PC cheap? Or maybe a simular
cable/adaptor?

Thanks,

Cheapest to build your own of course
http://www.geocities.com/atarimods/atari.html

eBay is a good source for inexpensive cables. The seller is a newsgroup participant and manages to get them to people from Poland<?> for less then people in the USA are willing to make them.

They're $40 on eBay. The cheapest I've found so far is $25 from
www.atarimax.com, which is much better priced. Although I paid $6 for
my XE1541 cable to connect my PC to a Commodore 1541 disk drive, so it
seems high still. :) The interface does look more complex
though..That's why I asked if there is a cheaper type of interface.

OK I have to admit I was impressed by "16 colors with 16 intensities"
and I knew that 320x192 was monochrome. But what I didn't know is that
16 colors was in 80x192. How does anyone even consider this to be a
usable mode? I know a lot of Commodore 64 games are programmed in 2
pixel dots because you can only have 2 different colors in a 2x2 area
(4 pixels). But otherwise it's 320x200 at 16 colors. Also text is
40x25 with 16 colors. What I found the MOST shocking is that there is
no 16 color text mode. This is MIND BOGGLING. Sorry, never had an
Atari and am looking to get one but this was my first discouraging
discovery today..

Thanks,

Tom

Oh and how do you have a graphics mode of 40x24??? why bother?? and
why does a lower resolution mode not support more or atleast the same
colors as 80x192?

I know this is 70's technology.. but geesh!!!

why did they release the xe series in 1985 without at least 320x192 16
color graphics and 40x24 16 color text??

 ok end of rant lol...   may still get one :)

The Atari has weaker graphics and weaker sound, but there are some
interesting games for it. It has a vastly superior disk system to the
C64, for sure. :)

Hi,

I have built a few for people who needed a cable, but...

You can build one for about $8 from parts and about 1 hr if you can
wield a soldering iron. I would suggest building one that piggy-backs
the SIO port from cutting up a SIO cable. I typically mount a db-9
just above the SIO port and use a db-9 extension cable to connect it
to the PC.

Or get one from Steve at atarimax.com for about $25-30 that has both
SIO2PC and PRO System in one little package. No need to build two
separate cablesand saves cable swapping when/if you need to use the
PRO system.

I would choose the latter if you cannot/shouldn't use a soldering iron
:) and you can afford it.

Rory

Don't discount the graphics so quickly. One of the more popular video modes

is 160x192 in 4 colors. However, with the use of Display List Interupts, it
is possible to change the palette between scan lines, effectively allowing 4
colors per scan line.

http://www.atarimagazines.com/compute/
issue47/153_1_Atari_Display_List_Interrupts.php

Remember that the Atari was created well before the C64. The C64's graphics
look primitive compared to a modern PC, so you have to compare it with what
else was around at the time it was created.

Well SIO seems more versatile.. But is there a 1581-like drive for
Atari?

The CPU is faster, and the basic is better too. So these are some
other plus points. Luckily the program I want to write on it doesnt
use graphics at all, but does use text and was a little shocked by "5"
color text. How on earth do you come up with 5 colors? How does that
fit into memory? Usually colors are powers of 2. (2, 4, 8, 16, etc)...
  Are they just the same 5 colors or can you change them from a
pallete?

I was already at the "buying" phase. But after reading that today I'm
taking a step back and will be playing with the emulator a little more
in depth to see if I want one.. I will say at least for 1979 the Atari
800 was a nice piece of history. I think the VIC-20 probably still had
16 colors at a higher resolution though.

On the other hand atarimax.com has a neat IDE/flash interface and
SIO2PC interfaces for pretty good prices..

Thanks,

Tom

Sorry, try to find someone in the USA to get it for you then have them ship
over to you. Thanks.

I can use a soldering iron well, used to solder for HP. But finding
the time with kids is another story!! :) I think I'll go with the one
at at atarimax.. What is the PRO System about anyway?

Thanks,

Tom

OK that makes A LOT of sense and makes me feel A LOT better!

It explains why many of the games look the same on the Atari and the
Commodore 64... As I said earlier, although the C64 is infact capable
of 320x200 at 16 colors, many games are essentially 160x200 anyway
because of the 2 color per 4 pixel limitation. Often the games only
have 2-4 colors in one area of the screen anyway.

So each scan line can be 4 colors of a pallete? I assume that pallete
is 16?

Is the text mode the same way? 5 colors, but 5 colors from a pallete of
16? If so that'd make me feel a little better too, because I doubt I'd
write a program that uses more then 5 colors at once anyway..

Thanks,

Tom

Oh and the Atari 800 may have came before the 64, and was indeed
impressive at 1979, but the 800XL came out around the same time as the
64, and the XE series came out way after the 64.. They could have
implemented better graphics modes then. I can see why the XE (not to
mention quality issues) series was a major let down to many Atari
users. The 800XL at least wasn't *that* far behind the 64..

Now about sound. Doesnt the 64 have 3 voices, and the Atari has 4?
But it's agreed that the 64 had better sound.. Why is that?

At least the Atari has a faster clock speed and more BASIC commands..

Thanks,

Tom

Did they for later Commodores 64/128's?

  I can see why the XE (not to

Bugger all difference when you get down to it. Like most limitations the
programmers got around them eventually.
>

> is 16?

The palette is 256.

With the right technique (aka G2F - Graph to Font) using
Player-Missile-Graphics ("Sprites") and redefined characters you can come up
with the most impressive results. Check this out:
http://www.atarimania.com/detail_soft.php?MENU=8&VERSION_ID=16847

Even without G2F the most flexible ANTIC and its Display List in combination
with the GTIA is quite a bag of tricks. You really should check out some of
the demos made for the Atari to see what's doable.

As for the sound: This really comes down to a matter of personal preference.
The Atari's POKEY (responsible for sound amongst other things) was found in
quite a number of arcade games of its time, hence no wonder Atari used it
for its computer line.

Many say, the POKEY is capable of better sound FX than the C64's SID.
Personally, I'm a bit undecided. I love the huge SID sound, but I'm also
really digging the edgier sound of the POKEY. Check out the clicking
percussion in "Jet Set Willy", "Red Max" et al.

Then look at the Atari 520ST, which was sold at a lower price than
the C128 in the UK. I like the C128 and I was a bit disappointed
when the specification of the Atari ST computer series was
presented. But all in all you could se the ST as a huge improvement
over the 8-bit computer, still priced like an 8-bitter.

Tom,

It for archiving your copy protected software to an disk image. It does pretty well in doing mosts disks I've run across. For those who don't have a bit copier/Happy disk drive. More information on Atarimax.com website.

Only one problem, only compatible with APE and a real Atari. I would like to see the .PRO system implemented in a Atari Emulator, so I can used my atari software without dragging an Atari along...

It would be nice to put a bunch of PRO images into my laptop and finally have a portable atari with a big LCD...<Sigh>

Rory

For the 128. It was better. It came with an 80x25 chip. It came with
an advanced BASIC. The 128 was a decent 8-bit at the time of release.
The XE series I would say was lacking where the C128 was not.

As for the sound/graphics. I TOTALLY understand now. I ran several
games in emulator last night comparing the same game on the C64, and
saw that the graphics were *almost* the same. I did notice some games
had a little less color, and I counted horizontally, sure enough it was
the 4 color limit. I also noticed Commodore picked nicer hues of
colors.. Like orange on the C64 looks much nicer.. The sound did NOT
sound ANYWHERE near as good as Commodore 64/128. So I totally get what
people are saying there.

That said, I'm still interested in getting one...

Thanks,

Tom

Oh and I discovered Pitfall II for the Atari 8-bits has a second level
after beating the first! That's enough reason right there to get one!!
Hehe.. Although the C64 version had nicer graphics, but it looks like
whoever ported it took the time to DRAW better graphics, so the Atari
version probably could have had better graphics too..

Thanks,

Tom

Have a look at landfall on the 800XL. Lovely graphics.

Like to try it out, but after a google and atarmania.com, I find no
results. Is that the full name? Got a link?

Thanks,

Tom

Hello,

Getting an 800XL soon and need a good book to learn it's BASIC. I know
BASIC on many machines so I'm not a newbie, just new to Atari. Would
like something with some good sample programs to type in as well as
good reference.

Thanks,

Tom

Hello,

I am looking for an Atari 800XL with 1050 disk drive, with all
necessary power supplies/cables. Must of course work and be in good
shape.

Thanks,

Tom

OT:

Rick, I've been meaning to ask this for a long time.

To make the 14C89 SIO2PC compatible with RI and DSR need these be on a
switch? I mean can I just tie them to the same pin on the 14C89 and
have the circuit work for either line?

You're planning to time travel, aren't you? You're going to create some
super duper game or application software for the 8-bit then go back in time
and market it big time, right?

Hey Tom - I've dropped you a line with some spare books I have that I can
send your way. Let me know here if you don't receive it.

I am not sure if it is the case with all 800XL and 130XE units, but on
the ones I have seen, the 130XE gives slightly better screen quality
when connected to a TV set with an RF cable.

If you ask me which is coolest, here is how I would rank them:

1. Atari 800 - super cool
2. Atari 400 - super cool with console feel
3. Atari 800XL - cool
4. Atari 600XL - the small footprint is cool
5. Atari 130XE - not so cool (but the most useful one)

Anders

After my "slow backup" issues trying to copy my HD with a Dos-style
backup utility, I decided to go after it with a sector copier. In
truth, there are many excellent sector copiers available, but for this
job, I thought I'd write my own, a Q&D one in BASIC -- no machine
language -- just POKEs to the Device Control Block. It only took about

an hour to get a fully-functional copier, so little time was invested.
Here are the times for 1000 sectors R/W FROM the hard drive TO an APE
ATR image using (registered) WinAPE at "3X."

```
Atari Basic   156 sec.     screen on
                   121 sec.     screen off

BXL             103 sec.    screen on, FAST mode
                     86 sec.    screen off, FAST mode

BXE               89 sec.    screen on, FAST mode, BXE extensions
                     81 sec.    screen off, FAST mode, BXE extensions

Turbo Basic XL   91 sec.    screen on
                         79 sec.    screen off

ABC Compiler  77 sec.    screen off
```

After running the copier/benchmark several times, it bacame apparent
that BXE and Turbo Basic XL are quite equal in speed for this task --
sometimes one was faster, then sometimes not. I also expected that ABC
would generate some improvement, but there is essentially none.
Evidently the more modern interpreters can POKE about as fst as ABC.
The next step will be to replace the "POKES" with ML routines and see
what improvements that makes. -Larry

Actually, ABC doesn't translate the code to machine language. It is
still interpreted. ABC translates the basic tokens to a p-code that is
again run thru the runtime package. It is still faster because this
runtime environment handles only integer mathematics and is quite optimized.

So long,
     Thomas

I think cartridges have more trouble with oxidation of the card-edge
contacts than the on-board chips. Dunno what the life span of a plastic ROM
is.

OK, how'd you do a sector read/write without at least one USR call?
You can set up the DCB, but it still requires a USR call to SIOV..?. E459

Hi Thomas and Russ-

Over the years, I've tried to find some clear, concise information on
P-Code Compilers (like ABC), but have yet to find anything that
provided much useful info. Most of what I've read goes into creating
machine code by converting BASIC to Assembler equivalents; then
naturally to ML. One of the Data Becker (IIRC) series for the C64 was
quite good, and I "slugged" my way through that. There was also a
really good series in AHOY! on creating a C64 Basic Compiler, but the
mag ended its run before the series could be completed! Don't believe
that I ever read anything serious about compilers for the Atari 8-bit.
Maybe there were in Europe or UK.

Sure, I had to do the X=USR(CALL$E459), but that is still a Basic
command. Just no LDA, STA...to set up the DCB. Just POKE, POKE, POKE,
and POKE some more. :-) -Larry

OK, I call USR calls machine language. X=USR(ADR("hLY(d)")) is
PLA JMP E459. You can do a lot of ML stuff that way, often loading
a string with DATA reads, then X=USR(ADR(A$)). A common one
is an IOCB call X=USR(ADR("hhh(*)LV(d)"),16) for a CIOV to
Channel 1. Certainly a lot faster than BASIC GETs and PUTs.
I never got to doing MAC65 programming. I would do stuff with
ASMEDitor then maybe put it in a string for use in BASIC.
but I ramble.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated. There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.) This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.

The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

RELATED NEWSGROUPS:

I have recently downloaded a load of exe's/com's and XEX files from
the internet

Apparently atari800win+ allows you to use these files thru Atari dos,
set up as a Hard disk directory

As I understand it all you do after loading up the emulator, is to go
to Atari, then hard drives and select which HD you want and tell that
HD where the downloaded XEX/exe's etc files are, Now I know that

atari's own dos's don't support hard drives but mydos, bwdos and
spartados does

Now I have figured out how to get Sparta and bwdos to look at the hard
disk directory with the exe or xex files in and I can get it to display
the contents of that directory in ataridos format (8x3 characters)

I just want to know if I can get mydos (v 4x and higher) to display
this hard drive directory and if mydos is compatible with
atari800win+'s hard drive option, if so how can I display the
contents of the hard drive directory (in mydos) and also for copying

I have also found out how to create (in mydos) very large Atr's (15
megs in length), however, I notice you cant use this disc with Sparta
or bwdos, is there a way of Sparta or bwdos creating v. large Atr's
(15 megs in length)

Additionally is there a way of multiple file copying from a hard disk
directory to a disk drive using spart/bwdos, according to their manual
you can use the following

(assuming you're already in H1:)

H1: copy *.* d2 (or whatever):*.*

All I get is error ** or file not present

Or is there a utility or ATR that will enable me to copy hard disk
directory file of atari exe/xex etc files to a large ATR disk created
using atari800win+ (formatted using mydos)

Also I am looking for a PC utility or Emulator ATR that will allow me
to convert Xex/com/xex file to CAS format

I am looking for a PC utiliy or emulator ATR file that will simulate
ATR sector loading or Atr loading and displays sector number and load
address and any run/init addresses (during the load), mostly for Atr's
that load in extra data like Zork, Gauntlet, Threshold etc as well as
normal ATR's (games that don't load in extra levels)

I am familiar with the disk i/o locations (0300h to 030bh) and also the
run/init locations (2/3 and A/b/c/dh and also 02e0/1/2&3h) but some
programmes tend to scramble this info

Also I am looking for a PC util or Emulator ATR that will copy back
xex/exe/com files to cassette/cas boot file, preferably to handling
files/file more then 300 sectors (400+) and those that have complex
binary file structures (like packed files generated with
superpacker/cruncher 5, that have been appened together)

Wildcards don't seem to work for me, but straight H:FILENAME.EXT
D2:FILENAME.EXT works for me. Read the HELP file for your emulator, lots of
good information.
Also make sure you have assigned a folder on PC to be the hard drive for
emulator.   If you have been able to assign the OS and Drives.

See my other post... Alas, checking the QL directory, I'm not too sure how
good the site is...
I just tried a couple of the zip files there, and they both came back
broken.
(I think he screwed up his encoding on the page and marked them as text/html
or something, downloading in forced binary mode didn't help either)

I suggest Best Electronics. Google atari best electronics.
The page is big and you have to search for the phone number to call,
it is near the bottom I think. They are in California and list their call
times.
Oh, here's the URL.

 http://www.best-electronics-ca.com/

I'm not affiliated with Best. Probable also is Video 61, Bravo Sierra,
B&C (http://www.myatari.com).

Just checked, there were some broken archives in some of the sub directories
for that machine, removed 'em - will restore later from another backup.

cheers,

Lance

Nope, just tried "60games.zip" and that came out blank too.
(not empty, blank, as in, full of nothing but chr$(0) (NUL) chars)

How much of the DCB must be updated each time DISKINV or SIOV is
called? Certainly things that change like the buffer addresses and the
sector addresses would need to be updated, but how about the things
that don't change? For instance DDEVIC ($300) is going to change;
DUNIT ($301) may not change for many iterations; likewise DCOMND ($302)
may not change until changing from read to write after many calls.
I've never seen this info before, and most programs that I've seen just
re-write the entire block each time. Anyone?

> may not change until changing from read to write after many calls.
> I've never seen this info before, and most programs that I've seen just
> re-write the entire block each time.

About the only thing you need to re-write each time is DSTATUS(sp?), 0x303.
This is because this variable defines the transfer direction on a call
(0x40: Reading, 0x80: Writing, 0x00: Status only) and contains the error code
on return, so the original contents is lost. If you use DISKINTERF, 0xe453,
then you don't need to fill it as the resident disk handler does this for
you. However, DISKINTERF cannot handle the "write without verify" command
for OsA, and the "format extended density" command up to the XL Os, it is
therefore of limited use. Most DOSes I've seen use SIO instead (0xe459).

So long,
     Thomas

> address and any run/init addresses (during the load), mostly for Atr's
> that load in extra data like Zork, Gauntlet, Threshold etc as well as
> normal ATR's (games that don't load in extra levels)

Well, sector numbers should be easy to obtain. I think a simple "printf"
in the emulator core will do it. For atari++, there's one class that
interprets sector loading, and hacking it up for that purpose should be a
piece of cake. Load addresses, however, are not so easy to obtain in
general. Of course you could still hook into the SIO patch of the emulator
and get it from there, but this won't work in case the game uses its own
sector loader. Examples for this are rare, but there are some: Most Lucasfilms
games come with their own disk device communications, and so does FS_II.

> I am familiar with the disk i/o locations (0300h to 030bh) and also the

> xex/exe/com files to cassette/cas boot file, preferably to handling
> files/file more then 300 sectors (400+) and those that have complex
> binary file structures (like packed files generated with
> superpacker/cruncher 5, that have been appened together)

As long as the file itself is a valid .COM file and doesn't require any
additional tricks for loading, this is an easy exercise.
Load the "COM" file as disk image into Atari++, then use a disk copy
utility to copy this "disk image" into an ATR. Atari++ builds a binary
loader for the COM file in front anyhow, and you can use this loader for
your own purposes to make "COMs" bootable. That is, as long as the "COM"
boots from Atari++ fine as "disk image", it will also do on real hardware,
and on other emulators.

So long,
     Thomas

Hi,

> Plus, most 800XLs have socketed chips making upgrades and repairs a lot
> easier.

Not necessarely. Some later releases have the chips soldered in. I do
have such a release. It was a pain to repair when the Basic ROM broke.
BTW, this release also came with a Rev C Basic.

Hi folks,

please find a new release of the Atari++ emulator for Linux and win32
in its usual location, this time release 1.45:

http://www.math.tu-berlin.de/~thor/atari++/

This release is mainly a bug-fix release that addresses a couple
of problems that have been pending for quite a while. Most notably,
the release addresses incompatibilities to the latest GNU and
Microsoft compilers, fixes a couple of bugs in the H: handler
(append mode didn't work, binary load had problems) and in the
Os++ emulator Os, namely in the FMS. Then again, I had one bug
report concerning timing of the HSCROLL register (got fixed) and
another one concerning P/M DMA that is likely to be fixed now.
Thanks Sebastian for reporting these.

I think it is also time for another new "stable" release. Thus, if
you find any bugs in this one, I would be pleased to collect your
reports. Similarly, new feature requests are also welcome, but probably
won't make it until 1.50.

So long,
     Thomas

No, that was the PC-1. I have one of these in-transit to me now, should be here in a day or two. The owner sent some very nice pictures of the system. I can probably post them somewhere if anyone would like to see them. You gotta love an Atari made PC in a MegaST/Megafile case. The one I'm getting is even modded, a toggle on the side of the case to turn of the keyboard click.

Charlie

G'day Tarkin, sorry about taking so long to reply, but since, as Shawn
said, the items were all spoken for, I didn't think there was much point
perusing this newsgroup to see if there was any interest posted. I
include my email address in my posts so folks interested in the items
can contact me directly, rather than yakking on here, and the two people
that took the items(both before you posted here anyway) emailed me, plus
I've had some computer troubles here, and looking over the newsgroup was
the last thing on my mind.

Adios,   Bob

The only time I ever wrote using DISKINV was a small disk sort program
for AtariDOS 2.5 called 'A-Sort 2.5'. I wrote it in MAC65 and was one
of my first assembly programs. That was circa late 80's/early 90/s. I
added an option to turn off screen output to help speed it up. Worked
remarkable well and at top speed of the 6502 processor. Even if you
leave 3 or 4 lines of screen output and do a jmp waitvblank its much
faster than having an entire screen with nothing essential going on.

Hi

Does anyone have the original cartridge "Hypnotic Land" by Lindasoft?
Not a fantsatic game I know, but I am looking for a scan of the packaging
from when it was released by Page 6 ....
Thanks,
P

Just browsing through http://www.page6.org forums and I found a link to
http://atari.fandal.cz/. This seems to have almost every demo written for
the Atari ever! I suggest you take a look at both sites if you haven't so
far.

Thanks,

Mark

I have some spare GAL16V8's sitting around and a 1200XL that needs
upgrading. Does anyone know where I can find a .JED or WinCUPL .PLD
file for the 800XL MMU?

Thanks,
Dave

Hi,
Great release, glad to have this update. I was wondering if I lost the icon
in the Win binary when I unzipped the file, or ... works great other wise..
RoyE

okay, I can solve most 1050 faults, but this drive has me beaten so far,
speed fine, reads perfectly, but will not format or write, I have changed
the drive mech for a known good drive, checked all connections, replaced U13
with a known good chip, and even added a write protect, enable override
switch, and still it will not write to a blank disk or complete a format.
Anyone got any idea where to look next ?

thanks in advance

Richard

IMO try a couple of new floppies from different sources before you go
any deeper. This is the same type of error you get when you have a bad
spot or batch of bad disks. Atari's don't mark spots as bad during the
format and keep going, they just bail out with an error.

thanks for that, sorry I should have said that I have tried a selection of
disks, some new old stock, to no effect.

Richard

Hello,

Spent most of the years playing with Commodore equipment, but been
curious about some of the Atari 8-bits. If I was to get one, wich one
do you guys recommend and why?

Thanks,

Tom

I was backing up my hard drive to an APE large virtual disk of 60000 DD sectors. My backup program was the Hard Disk Backup Pro. In this particular case, most of my directories were 3-levels deep: Root:Sub1:Sub2:Files. I realize that creates some additional overhead for the file system, but I was amazed at the amount of "thrashing" going on by the time I got toward the end of the disk. The backup of apx 55,000 sectors took almost three hours using 3X speed. Whew!

I can't say for sure what was going on, but it appeared that every time a new file was written, the backup went to the root directory, then to Sub1 then to Sub2 and finally wrote the file. In the case of appending, a very small part of the file was written, and only (it appeared) after re-reading the file to that point. (?)

So was this a MyDos issue, or an issue with the virtual disk (a large random file?), or an issue with the backup program? I have a HD backup program that I wrote, but it does not support more than one level of subdirectories, so I can't compare these results with it. Certainly I'm going to compare this to sector copying -- can't be any slower.

Can anyone shed any light on this?
Thanks,
Larry

Been there done that! What hard drive system are you using with APE..
MyDOS has a few problems with MyIDE rom versions below 32f. The black box
should do it okay, there seems to be better buffing of data stream. The
noise is probably caused by fragmented files on the hard drive (you might
even have several directories fragmented.) Sector coping has been discussed
here several times. A program called SECTOR17.COM works well on the
emulator from ATR to ATR but slow from APE to hard drive or hard drive to
APE. 64 directory entries per directory SUCKS big time. But I concider my
time doing this was well spent. I now have a hard drive with 26 directories
filled with atleast 1600 game XEX files.. and picodos and associated text
files for long file names. Enjoy it can only get better- I HOPE.

Thank you for posting this! It was cool to see the map over this great
game.

About Swordquest, was there only eight rooms in that game?

Hi Roy-
I'm was using the Black Box. I have not heard of "SECTOR17" -- a PC
program or A8?

The two folks that posted here, that were interested, both backed out
due to shipping costs(both wanted ALL the items, so the package was
about 10lbs.), so this stuff is still available.

If anybody wants any of these items, please let me know within the next
week, otherwise it's off to the garbage dump.

Folks, we've had really severe weather here in the last 24 hours.

(tornadoes, high wind, intense rain, cats and dogs-living together...<cough>, er wrong movie...) :-)

Anyways, we were without power for much of the last 24 hours. Which far exceeds the UPS I've got on the BBS.

Our normally stable dynamic IP address changed, one of only 2 times its changed in over a year.

Its now: 24,177.23.112

Until my server gets this updated, you'll be unable to telnet to "bbs.darkforce.org" although the actual IP address will work.

Thanks for your patience and sorry for any inconvenience.

Hey all,

I been working in the basement this week and found several binders and boxes of 8 bit game documents (photocopies of manuals, box covers, etc) from owners of old bbs's who collected this stuff long time ago. I just came into owning a duplex scanner and started to convert the docs to PDF.

Most of the photocopies are of poor quality and mostly incomplete (some have box scans, warranty info). Most SSI and Avalon hill games have 'hex' grids with text embedded in them, and most of those are illegible after scanning. I still have at least two more binders to go and several boxes of manuals to scan. Some of these titles are old, and some I've never heard of before. The scans still need to be compressed before burning them to CD or DVD...

My questions are... Is anybody looking for games documents? Is partial docs better than none?

I intend to replace PDF's if I come across an original.

The list of actual files are on my ftp server. You can log on and view the list, but cannot download them. I dont want someone to start downloading the entire catalog. If you want a few, no problem. If you want more than 2 or 3, I can burn them to a CD or DVD for a nominal cost ($1-2) + shipping. Most of the ones in the 'P' directory are better than the ones in the 'W' directory.

Here is some info:
ftp: fujiman.no-ip.com
login: ataridox
pass: listplease

If you need to get ahold of me:

fujiman(no@spam)netzero.net

get rid of the parens and the obvious.

Thanks,
Rory

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

On HDD's that need the parity mod, you usually don't need to use
HDFMT.COM.

The error message looks familiar, but I can't remember under what
conditions it appeared. A long pause usually happens, when the HDD can
not be accessed for some reason. Is everything connected corrctly? If
you want to, I can sent you a piece of software (very crued) that will
read the (512 byte) sectors of your HDD, so you can check if the
configuration data is written to sector zero correctly.

Ten year old SCSI drives? I have an old Macintosh LC with its original
40MB Quantum drive, and it purrs like a kitten. No bad blocks, no
hesitation at startup, no disk read/write errors, and this disk is about 14
years old now. A 160MB Connor SCSI disk that was in my LC575, is just
stating to show some problems now. This drive was bought new in 1995, so
it's about 11 years old.

The 160MB Connor drive still works great, but there's a little hesitation at
powerup. It sometimes takes a couple minutes or so for the drive heads to
swing into place an begin reading the disk. Once the drive is up and
running though, it runs great with no problems at all.

Contact me @ nuke48386 AT yahoo DOT you-know-what.

10lbs is a pittance for shipping, unless you're talking
next-day air.

Aside from a missing ram chip. do you recall what was
the matter w/ the mainboard??

Thanx,
       Tarkin

I have an MIO on Ebay...

The auction is supposed to be a low bidding event...

My apologies in advance...
=====
I wanted to tell you that I have a high shipping cost placed on this
auction. I will be charging $330 + shipping + auction ending price.

I dont think people are aware of it. It's my way of getting money back
from ebay by not paying them fees.

There is a reason for it.

I got screwed on a scanner I bought online for $410 of which I have
only got $175 back(and will probably be all I'll ever see). Through
the loopholes of Ebay/Paypal they will 'recover' $200 minus $25 fee of
any purchase. Yet another reason not to use ebay/paypal. I've been
burned and this is the only way to recoup.

Thanks,
Rory
=====

The shipping will be $330 + shipping put ending auction.

People may be bidding without checking the ship/handling calculator.
I think I understand the ship concept you're trying to achieve, however
your statement in the description is misleading.
I quote your description:

"The shipping costs will depend on where you live. I have set a fixed
shipping amount, but you can save shipping by winning more than one auction.
Thanks for your understanding."

Your explanation here is acurate, but people may be shocked by the
shipping amount. Shipping won't vary much " ... depend on where you live.."
Sorry.

Happy belated birthday, Ben.   Also, good to see that you're finally making
the leap to 80 columns.   Welcome to the new millenium.

I will be very interested to see how this plays out -- namely whether
the "winner" had a clue about your shipping charges. But I've seen
shipping charges like this before -- but it was on an tractor... ;-)

Was the PC2 the Atari PC that was housed in the modified Mega ST case? If
so, I recall having wanted one of those as well.   I remember reading an
article in an old Compute! magazine about it's introduction -- a CES or
Comdex show report, I believe.

Anyway, Atari was expecting to sell a tonne of those boxes. At least that
was the hype from the magazines of the time.

Interesting! Your site don't work, dude. If you're going to spam the newsgroups, at least provide a link that actually works.

Did anybody ever produce a Unix-like OS for the Atari 8-bit? Not an actual Unix, but something that looks and feels like a Unix? I know there was SpartaDOS, which was a command line OS. Though I would hardly call SpartaDOS Unix-like.

I remember ordering a DOS from Bellcom that was written entirely in Basic. It wasn't Unix-like, but MS-DOS like. It wasn't very useful, being that it was written in Basic -- at least the user interface portion was written in Basic. The actual DOS.SYS was Atari DOS 2, I think.

Hmm, what was that called? Mecc-DOS, I think.

Anyway, was there ever any effort to create something Unix-like? i.e. a DOS that used Unix like commands?

My how times have changed. Even I am not supporting Mr. Murray any longer.
Yikes!

Are these devices still being produced by CSS?

Last I heard, the Floppy Board can *possibly* be purchased from CSS. I
know that Bob has enough parts to build one more batch of Floppy Boards,
but there needs to be enough demand from users for him to do it. If you
(or anybody) wants one, let Bob know!

I didnt mean to deceive anyone except Ebay.

The current high bidder has been notified and said, basically, cancel
your bid if you want. I'm not going to hold anyone to the bids that
they made under this situation.

Seems a lot of people on Ebay puts things on ebay for ridculously low
prices (.01 for Buy it now) for expensive items to cheat ebay out of
closing bid prices and make the money on shipping (which ebay cannot
touch, yet...). I'm not wealthy enough to let $233 slip through the
cracks. I really needed the scanner*. I waited 3 weeks for nothing to
show up, meanwhile the bad seller has my money and already spent it. I
get a partial refund from ebay and was told to recoup the rest from the
seller (who probably used fake info). I had no protection from being
frauded. Paypal defaults to a bank transfer instead of a Credit card
(which I would have had protection). Things just went horribly wrong.

I'm NOT going to let the money slide.

I'll always check to see how much stuff is going to cost to ship. I
want to know the ballpark price I will be paying. Expensive items (more
than $200) I will only pick up in person which pretty well defeats the
purpose of Ebay.

I guess I could just pull it off ebay and sell it some other way.

Rory

I'm back! I have a new name now, too! I'm now known as AlbaClause. As you may have figured out from reading the signature at the bottom, AlbaClause is a contraction of the words Albatross and Clause.

For the illiterate and dictionary deprived folks cruising the group, I'm going to pull out my big red Webster's New World Dictionary and provide you with definitions of the words Albatross and clause. Here goes:

Albatross: 1) Any of a family of large, web-footed, tubenose birds found chiefly in the south seas. They have long narrow wings, and a long, hooked beak. 2) A burden or source of distress, especially one that impairs effective action.

Clause: 1) A group of words containing a subject and a finite verb, usually forming part of a complex or compound sentence. Clauses may be joined by parataxis, by modified parataxis, and by hypotaxis. 2) A particular article, stipulation, or provision in a formal or legal document.

I'll let you figure out which definitions I'm using for my handle. You can do it... I think you're smart enough!

You may recall that I used to frequent these groups under the handle "you". However, I've opted to cease use of that handle, as I really don't like you. Yes, sad but true.

In a closing note, if you happen to chance upon my website, and you have any knowledge of Debian Linux, you will immediately recognize that "woody" is the name of the old stable Debian distro. Although some rather large posteriored morning show hosts may believe that it is a reference to them, I assure you that it most certainly is not.

Note to Sarah Woodley: You're so vain. I bet you think this post is about you! :P

Anyway, ciao for now.

Dont be deceived, I've been doing 80 columns since 1985 with my 1040STF. I
try to support all my Customers. An 80 column user can still use a 40
column text. Appealing to the lowest common denominator. 40 column users may
not as easily adapt.

On Wed, 12 Apr 2006, AlbaClause wrote:

I'm thinking of buying an 800XL and installing a Wizztronics 256K
memory upgrade because I like the keyboard, and the cartridge port on
the top instead of on the back like my 130XE. I know the 130XE has
an additional expansion port on the back, but I'm not using it.
Would the 800XL function essentially the same as my 130XE with the
added memory? What are the differences besides memory? The video
 port has some differences, correct? I use the AtariMax MyIDE +
Flash cart with compact flash for a "hard drive."

TIA

LUnix for ATARI

http://www.strotmann.de/twiki/bin/view/APG/LngHowToBuild

Apparently only works on emulators.

To the best of my knowledge, the functional diffs (other than RAM) are as
follows:

800XL: Basic Revision B
130XE: Basic Revision C

800XL: No seperate chroma and luma on monitor output (on most anyways)
130XE: Seperate chroma and luma on monitor port (SVIDEO)

800XL: Parallel Bus
130XE: ECI port

-Jason Harmon

>From the factory, the 800XL has a much better quality video signal (TV
at least).

Plus, most 800XLs have socketed chips making upgrades and repairs a lot
easier.

If you use cartridges, the XL is also a much better choice.

Ok, maybe you thought I was kidding. You can use either the
yahoo addy (nuke48386@yahoo.com) or the account listed
with this newsgroup.

I goofed with the address to foil spam-bots, not imply that I
was jesting.

I will be disappointed if you binned it already, but not
earth-shakingly so.

TTFN,
      Tarkin

Hi Tarkin,

I took the rest of the stuff off of Bob's hands. (Thanks Bob!).

WDC made a 65c02 pin compatible version of the 68c816 called the
65c802. You just didn't have the 16MB addressing range, but everything
else was there.

"Lee" <melee5@my-deja.com> wrote in message
news:1143190337.483836.261200@j33g2000cwa.googlegroups.com...

<snipped everything>

I read through your post, and understand and agree with what you are saying.
But, I can't help but think you must have completely misunderstood me.

Ok, you don't understand... First off, use MyDOS option O to set up the

RAMdisk, then option H to write to disk. From this point forward, everytime you cold boot that disk, MyDOS will automatically set up the RAMdisk, but won't format it. Without doing anything at all, you can pull up a directory listing of D9:, and it works. But it reads the wrong sector count. On boot, the RD appears as a disk with 65280 free sectors. All that is required is to format it and you're ready to rock.

Now, since the drive is preconfigured at boot, you can pull up a directory listing of D9:, read the free sectors and compare to 65280. If sectors <> 65280, abort format because something is wrong or the disk has already been formatted. If CIOV returns with an error after trying to open the channel for dir read, then the disk isn't present.

So, open for dir read, if error, abort format. If no error, get free sector count. If sector count <>65280, abort format. Does that make sense to you now?

Hi Everybody

This BASIC program dumps my 800XL ROM to a binary file:

```
10 OPEN #1,8,0,"D1:OS.BIN":PRINT "DUMPING OS..."
20 PRINT "$C000-$CFFF":FOR I=49152 TO 53247:PUT #1,PEEK(I):NEXT I
30 PRINT "$5000-$57FF":POKE 54017,125:FOR I=20480 TO 22527:PUT
#1,PEEK(I):NEXT I
40 PRINT "$D800-$FFFF":POKE 54017,253:FOR I=55296 TO 65535:PUT
#1,PEEK(I):NEXT I
50 CLOSE #1:PRINT "OS DUMPED!"
```

I made this program according to the comments made by Thomas Richter on
this thread:

http://groups.google.cl/group/comp.sys.atari.8bit/browse_thread/thread/
f2e8fcd558f2330f/4a79bf042d6c4e9c

Can RetroJess use this program to dump the contents of his XL BOSS to a
binary file?

Regards

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

A few added details make a great difference, yes I do understand what
you are up to now, thanks. There is still a problem though. Under the
conditions you descibe above at boot up MyDOS is only preconfigured to
use the ramdisk, it has not been 'set up' at all. It will still pull a
directory on this ramdisk just as you say, but the value for your free
sector count is coming from random extended ram data that may not be
counted upon to exist each and every time you boot up. The data is in
a FF 00 FF 00 FF 00 pattern ($FF00 equals 65280) that often will skip
in other 256(128?) byte blocks of data with a 00 7F 00 7F 00 7F pattern
depending on if it's Tuesday. Depending on humidity and the phase of
the moon it seems, you CAN easily get different results. I've seen
boot up ram patterns with the hi byte of the Ram's address existing in
each 256 byte block, but never such that you could count on it. Your
machine however may yeild the same numbers each and every time and that
might go on for years. If that is the case and you don't mind it after
learning where that boot up free sector count really comes from, then
thumbs up, go for it as it will work just fine. But especially if you
modify your computer in any way like later adding Omnimon OS, a MIO,
even booting with a cartridge, you shouldn't be too surprised if the
boot up extended ram patterns change drastically and then your program
fails to work correctly.

I'm still thinking that you'll never get any error on a directory read
as the MyDOS ramdisk driver never calls the SIO routines for any
reason. The IOCB block and CIO routines are used, but that only to set
up the target sector number and get that data moved to the SIO 'block'
at $0300, from then on it's all done from the ramdisk driver code only.
 The ramdisk is also not accessable via any SIO calls whatsoever, thus
no SIO errors are even possible. This is why the VTOC fix program for

MyDOS does not work on the ramdisk as the program makes SIO calls
directly. I did mention MyDOS twists and turns didn't I?

Best of luck.

Lee

There's no OS at $5000-$57ff ? Unless there's a bank
switched self test or something, banking usually goes to $4000.

you know about Microsoft DOS's FAT and Commodore 1541's BAM. What is it
called for the standard Atari DOS 2.0, MYDOS and SpartaDOS? Atari ST ?

Thanks!
Jack

For DOS 2.0 and its derivatives, the closest analogon would be the VTOC
(volume table of contents, a bitmap defining the used sectors) and the
directory. There is no other name for the latter structure. The Atari ST
used AFAIK only a mildly modified version of the FAT system. DOS 3.0
was very much FAT like, too.

So long,
     Thomas

<snip>

Yes he can, your Basic program works perfect here in creating a
suitable rom file for use in emulators or PC based eprom burners, good
job. Atari based eprom burners would need an appropriate file header
added to the OS.BIN file but that is no big deal. Now, if google
groups might let me see an email address to contact so that I might get
it too. Use BOSS in the subject line.
Lee_454*AT*yahoo.com

I may have it already but on my first attempt to find it, it's a no
show.
TIA
Lee

The C64 allowed 4 players as well, but two had to use the keyboard. The
copy of M.U.L.E. for the Atari that I have doesn't work on my 800 and my
800xl has defective keys and cannot play the game. I've won an auction
for another 800xl that is supposedly tested and working, but it hasn't
arrived yet.

They do appear on EBAY every so often.

Are you looking for just the console or do you need the keyboard, light gun,
controller, rf cable, and power supply?

Thomas

Yes, rarely. :)

And often "yellowed" badly.

Russ, I believe that the self-test is banked in at $5000. 54017 is $D301
(memory banking control) and 20480 is $5000.

Does your 800 have some kind of custom OS chip in it? EA was one of
the first companies to check for omnimon and other chips at $C000 and
refuse to run in this situation. Mule should run on an 800 no problem.

Recently I was browsing Google and came across an article that was talking
about torrents for atari files. I downloaded one of them but neither atari
setup I have would run it. I then tried it on the emulator I use and still
no luck. Probably packed or encrypted. Does anyone know if there is an
unpacker for this kind of atari file..

TIA

Can you be more specific?

Which torrent? The name of the file should indicate the type of
compression software that was used.

Where did you get the torrent? That might help us.

Which bit torrent application did you use? on what platform?

Are you trying to run the actual .torrent file? That is just a
pointer for a Bittorent appl (simplied explanation). You need to get
a Bittorent App (Azureus is best IMO) and then use that to download
the file.

I've heard of this joystick swapping business and it turns me off. Also if
your copy of M.U.L.E. doesn't work on your Atari 800 there's definitely
something wrong with it. If you have the means to be able to do it,
transfer the mule disk image from the downloads page on
http://atarimule.neotechgaming.com to a floppy.

OK so this isn't to run on the Atari but will run with Azureus to download
an actual Atari file. OK .. I 'll try to Google for Azureus and read more
about the file type. Thanks for the quick responce..

http://gizmodo.com/gadgets/pcs/the-wonderful-world-of-casemods-163217.php

A kind reader sent in this cool cavalcade of case mods, including the
Atari 800 mod, the Pokemon Laptop, and the famous Kana PC, shown here,
which looks like its maker spends hours inserting and removing flash
drives all over it.

We've seen these all, but it's fun to see them all in one place.

I wrote the same program according to his comments, though for some reason I
POKE'd 54017,127 trying to turn on a bit, and of course this activated the
self test. I noticed you POKE'd in 125, that must have been my problem. My
ROM did end up working in the emu, just not the selftest. Cool, I'll have
to do it again.

As mentioned earlier, I'm looking at building a PBI device. I'm thinking of using a PIC18F4455 microcontroller connected to the bus. I'm concerned about whether this chip is actually fast enough, so I need to know the exact timings of the 6502's usage of the address bus. If it's fast enough, this single chip can read the signals on the Atari's bus, and emulate RAM and ROM, as well as provide USB connectivity. All for a five dollar chip!

How far into the cycle do I have to wait to read the address bus? The signal on PHI2 is low during the first half of the cycle. My understanding is that for memory reads, what matters is what is on the data bus at the end of the cycle (when PHI2 goes from high to low). How early can I trust the address to figure out what data to send?

If the chip in question isn't fast enough, they're announced some similar 16-bit microcontroller chips that should do the job, and I haven't looked to see what other companies are selling.

Also, if anyone knows where to get a 50-pin socket to build a PBI device with, that would be nice. I think the pin width is the same as for ISA sockets, so I'm thinking one option is to desolder some off of an old motherboard and then cut them down from 68 to 50 connections, but it would be much nicer to start with the right connector.

I've got a few items taking up space that need to go, but since they're possibly of some use to folks still using Atari 8bit, I don't want to simply throw them out, so I'm offering them here for nothing more than the cost to ship them.

Anybody interested in any, or all, of these items please contact me soon, because if there's no interest in approx. 2-3 weeks, I will resort to the dumpster, just to get rid of this stuff.

Here's what I have left, and the URLs of the pictures:

1.) Atari 600XL/800XL power supply. I just checked this with my multimeter, and it's putting out the correct voltages on the correct pins.

http://members.shaw.ca/bstin/Atari/Freebies/800xlPSU.jpg

2.) Dust Cover for Atari 800XL. I cut a hole in this, and sewed the edge of it so that I could leave my SpartaDOS X cart installed while also having the cover on the computer.

http://members.shaw.ca/bstin/Atari/Freebies/800xlCover.jpg

3.) Switch Box & Cable to connect the computer to a TV.

http://members.shaw.ca/bstin/Atari/Freebies/SwitchBox.jpg

4.) 800XL Case, keyboard, etc. This is the remains of my 800XL, i.e. I have the non-working motherboard(with no RAM chips on it) inside, as well as the shielding & screws, and the keyboard. If anybody wants just the keyboard, or any other part, I can pull the required item and ship just that.

A few people have contacted me to add their hardware project to the
project status page at http://projectstatus.atari.org, so hopefully
this is helpful. Please contact me if you would like to add your
project or modify the status.

I'm not sure of the exact timing requirements for a valid address, but
I have read before that RAM on the Atari needs to respond within 250
nanoseconds.

Atari DOS 2.0s can be thought of as the foundation file system.

Many DOS's like 2.5, and SpartaDOS add extended functionality like
enhanced density support (2.5), and sub-directory structure (Sparta and
some others).

Most (all?) "superior" DOSs remain 100% backward compatible, however
DOS 2.0s will have some degree of trouble with disks from other DOS's.

Then we have DOS 3, which was closer to FAT in some regards, but Atari
quickly realised it was a mistake and DOS 2.5 was released after it,
and reverted back to the more compatible structure.

The 1050 (and most other drives) only need the outside notch to go
double-sided.

There is no need for the timing hole, as it isn't used by the drive -
the timing is all software based.

Nice, but wouldn't it have just been a lot easier to use one of those
"cassettes" which you can use in a car to hook up your walkman?

They're cheap as, and would probably do the same job.

Or better still, just spend $5 on parts and make the SIO2PC/APE
interface.

Fair enough for trying though, my current hardware project is an
interface to hook up PS1 memory cards to the 8-bit.

To have a 400/800 perform a reset like the XL/XE (ie recover from a
lockup without losing your program), a modded OS would be required (as
well as the "proper" RESET switch).

Fitting it within the 8K limit of the existing ROM should be no
problem. Just use a 2 or 3 byte "magic" number and check it like on
the XLs. Probably 20 bytes or so of program code.

Hi Preston-

> ...I'm thinking one option is to desolder some off of an old motherboard and
then cut them down from 68 to 50 connections, but it would be much nicer to start
with the right connector. <

I was looking for the same thing a few months back. Jameco carried new
ISA sockets for a dollar or so, when I checked (PCB mount, right angle,
50-pin).

-Larry

Poking 127 will turn on the self-test rom but it also turns off Basic
which one would certainly wants to be left on by using 125 instead.
It's a wonder you didn't crash horribly right there.

Well it did 'crash' I suppose, the self test turned on and that was the end
of that hehe. I stopped trying to get the selftest, the ROM still worked
though.

Considering that the Atari runs at 1.7897725MHz (NTSC, slightly slower for
PAL), that works out to about 558.73ns per cycle. So given the assumption
that the spec is that the address lines are valid at the end of the first
half of the cycle, the RAM would have to respond in half a cycle, which is
279.37ns. Make that 250ns to have a safety margin, and there you go.

At least the math works out right.

I must be missing something. I thought the XL Boss was an 800
replacement OS. Why wouldn't you just open the channel to the disk
file; then PEEK the entire XL OS area ($C000-FFFF); and PUT each byte
to the disk file as they are PEEKed? Why the concern over the banking
code for an 800 OS?

Hopefully someone knows about SCSI error codes...
I am trying to set up a new hard drive with my BB (Parity mod is
installed).
I have correctly entered the drive data. The configuration data
appears to be correctly written to Sector 0. But when I select the
controller (SCSI embedded drive) there is a long pause and then I get
the following error message/codes from the HDFMT.COM (the BB
formatter):

"Mode Select Command Failed!"
"70,26 is the error code."
"05 is the sense key."

Any thoughts/suggestions?

Thanks,
Larry

Atari 1050 is an enhanced density drive. ICD, Indus, Rana, and Trak can make
the double density drive but why can not Atari company make the double
density drive?

Thanks!

Jack

Atari 1053 was a double-sided double density floppy drive for the XL before
XE's XF551. XF551 uses IBM style drive mechanism. right? So 1053 uses IBM's
drive? but why was it never released?

Thanks!
Jack

Atari was allegedly concerned about reliability in DD, and probably
with good reason. For that era of drives, DD was/is much more
difficult to make consistently reliable. Most any Atari drive in good
condition will read most any other Atari SD disk. That can't be said
of DD. My own experience with Rana, for instance, was many would not
even read their own disks in DD, let alone disks from on other drives.
So Atari "split the difference" electing to go with MFM, but 128 byte
sectors. As it turned out, the 1050 (and at least its Tandon
mechanism) was reliable enough for DD. Indus, too. If you want to
better understand the perils, pitfalls, and other problems with drives,
read "Beneath Apple Dos." Excellent and understandable, too.

>...So 1053 uses IBM's drive? but why was it never released? <

No, AFAIK the 1053 was to use a Tandon mech, with electronics still based on the 6502/WDC families. Same for the 1055. Why didn't they get released? Atari was bleeding red ink heavily at that time. Many things were cancelled. With new mgt., cutting cost was the order of the day. Some of the tests for any company that intends to stay in business is "can we make money developing and selling this product?" and "do we have the funds to put it into production?" and "is there a cheaper alternative?" At any rate, the XF551 (and its sibling the XF351) were clearly cheaper to produce (look at the boards and the component counts).

IMO using a microcontroller and doing all the interfacing in software isn't a good idea. You'll run into all sorts of problems with it.

Better use a CPLD (Lattice iM4A5, Altera, Xilinx). You can easily use one of the free development tools and write the interfacing logic in VHDL (or Verilog, Abel or whatever hardware description language you prefer).

Here are some important hints if you want to do this for the Atari PBI:

A lot of Atari XL/XEs don't meet the official timing specification.
Usually, the address and data lines should be valid for some time
(10..30ns) after the falling edge of PHI2 (that's the point where
writing to memory occurs). But Atari really built quite a lot of
garbage (especially in the end of the 8-bit area) and so you have
to take care of that fact (otherwise your hardware just won't
work correctly). With the old, slow chips in the 80s this wasn't
a big problem, but the modern, fast, chips will go crazy.

Protecting the address lines is easy: all modern CPLDs contain
a programmable latch on the input line. So just activate it and
latch these input lines with PHI2=high. According to the 650x
timing specification the address lines must be valid some time
before the rising edge of PHI2 and must not change while PHI2
is high.

BTW: it isn't a bad idea to protect the R/W line in the same way.
On the XL series, the LR/W line on the PBI is already protected
internally by a latch (but not the R/W line on the cartridge port),
but on the XE series there's no such protection.

When protecting the data lines, we have to distinguish between
read and write cyles.

Read cycles (memory to CPU transfers) are not critical. The Atari
CPU is so damned slow, it won't notice if the data lines are
already invalid some ns before the falling edge of PHI2. This is
also the reason why the "stabilizing the XL/XE mod" actually works
(it doesn't shorten only write cycle timing, but also read cycle
timing).

Write cycles are very critical. If the data lines are invalid
at the falling edge of PHI2, wrong data is written to memory.
If the address lines are invalid, data is written to the
wrong location. => Ouch!

The easiest way to fix write cycle timing is to shorten the time
when PHI2 is high: Use a 74HCT123 with R=5k6 C=33pf, connect A
to GND and B to PHI2 and use this signal for write timing (instead
of PHI2). The HCT123 generates a single pulse with pulse high time
depending on R and C after the rising edge of PHI2. The non-inverted
output (Q) now just looks like the original PHI2 signal, but with
and earlier falling edge.

Voila, rock-solid timing and you don't need to do any modifications
inside your Atari!

so long,

Hias

As Larry said: Actually if I have it right, Atari had problems even getting any drive to work. I'm not sure about which models but I am pretty sure that at least one, like the 1050, was developed out of house by an outfit like Tandon. At any rate, the 'not invented here' drive won out when the in house drive failed. Compare the rock solid PC board, shielding, etcetera, of the 1050 to something like the PC board made out of saltine crackers in and flaky connectors in the XF551 to see what we probably would have got from Atari.

I think I recall Bill Wilkinson saying the cost of the in house drives like the 815 was so high that you could buy 2 1050s for the same price. I imagine the 810 was an expensive drive to manufacture too and thus the incentive to replace it.

The 1050 enhanced density is double density. Double density refers to the bit density, ~bits per inch, laid down on the disk. There were all

kinds of single and double density formats back then.

Atari was limited in that they only had 256 bytes of RAM in a 6810 and a PIA type chip. Can't exactly have a 6502 stack and still have 256 bytes available for a write buffer. The XF gets away with it because the different chip, 8052<?>, has a lot of general purpose registers that can be used for storage of variables and what not.

I am of the opinion Atari would not have given us a drive with a lot of ram in it even though it made sense. For one thing, you would only need to add a single command to the ROM to get a drive that could defeat a lot of copy protection schemes. Just something simple like load RAM with code then JSR to it.

In 1985, 130XE and 64XE were released, 1050 should be replaced with XE's style drive but still have XL's style ? Like Commodore 64C and 1541C's white style as C128 have a match... When I bought 130XE, I was waiting for new XE's style drive but it was never released until 3 years later. How Come?

Thanks!
Jack

My 1050 had (c) Tandon on the EPROM sticker.

http://homepage.ntlworld.com/kryten_droid/Atari/800XL/1050/1050/1050_FDD.htm

There is RAM in the 6810 (128 bytes) and the 6532 (128 bytes RAM, I/O,
Timer) chips.

http://en.wikipedia.org/wiki/6532

I copied a 'disk doubler' using a spare 6502, EPROM and a 2K RAM (6116).
It would be easy for me to fit more RAM than the Atari 800 had :-)

Probably because of the cost, like everything else. Interestingly, there is
a picture of a never-released 1050 in XE styling on the back of the 130XE
box.

ICD sold the "US Doubler" 1050 upgrade that moved the drive up to full
double density. IIRC, it consisted of a replacement controller chip and
it seems like you had to check a jumper position. I had a drive with
that upgrade, as well as a couple of Indus drives and a couple of
XF551s. None had any trouble reading disks created with the others. (As
long as you stuck with single-sided in the XF, of course.) I used MyDOS
almost exclusively with my DD disks, if that makes any difference.

2006.02.27 Preston Crow, DISK 4.0 (sector editor and more)
2006.02.27 Draco, for KMK/JZ IDE: IDE BIOS 1.10a
2006.02.24 Eric Bacher, Dis6502 2.1
2006.02.23 Radek Sterba (Raster), Raster Music Tracker (RMT) 1.23
2006.02.15 MadTeam extensive update

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to

send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

I am an Atari cart collector and I was wondering if thre is a lifespan to an
Atari cart? It has been over 20 years on most of the carts and they all
still work. Anyone know if the memory eventually fades?

Mike Tennyson

Haven't had one fail yet through anything but physical damage.

There exists an extension for the 1050 which does this trick: the
1050 Turbo module by Bernhard Engl (released in 1986). It's just a
replacement for the 1050 ROM and consists only of a ROM chip plus
some logic ICs to do bankswitching.

I've always wondered how this really worked (yes, you need a 256 byte
buffer if you want to use 256 byte sectors). Some time ago I talked
to Bernhard Engl and he explained the trick: If you can live with
a subroutine level of 1 you don't really need a stack. Instead he
just used the stack-pointer as kind of a function index.

The software in the 1050 (turbo) is quite straight forward and using
only one subroutine level is sufficient. Consider what happens eg
when reading a sector: first the 1050 receives the command frame,
then it has to read either 128 or 256 bytes from disk, then it
transmits the data frame (either 128 or 256 data bytes) to the
computer.

After command frame reception, the software knows if the sector
is either 128 or 256 bytes. So it sets up the stack pointer register
to, lets say, 1 for "send 128 bytes" and 2 for "send 256 bytes"
and then jumps to the read-disk-sector subroutine. At the end
of the routine, it checks the S register and then jumps to
the right "send bytes" routine.

The fine thing about the 1050 Turbo was that it was a lot cheaper
than all the other floppy-speeders (like happy/speedy/...). It cost
only 99 DEM and with 49 DEM more you could add a printer interface
(this interface was connected directly to the module inside the
1050). And, the 1050 Turbo came with one of the most sophisticated
backup tools. Very fine thing and it was also very popular here
in Europe (especially Germany and Austria).

so long,

Hias

Real roms should last longer then you and your grandkids.. Unless they
are physically abused. (breakage, rust, etc)

Eproms.. They wont last forever, even if kept properly.

I do remembe seeing the matching drive, but I was never able to get it. It looked greatand would have looked super next to my XE.

Let's just say never. <g> Same here with me. All my carts work fine. I will say that some of my 8-bit disks do not work, but about 95% do.

What are some kinds of SCSI hard dries folks are using with their Black
Box setups?

I have not been able to get anything larger than apx. 230 MB embedded
"narrow" 50-pin (mine are SCSI II -- I think) to work with mine.

Is anyone using something larger? What brand/model? Any brands/types
to avoid? My current drive is getting loud, so I suspect it is going
to fail soon, and I'd like to replace it before rather than after!
Thanks,
Larry

Should have added this to the last post. Formatting seems to be an
issue with modern drives using the BB formatter. Has anyone been able
to format a drive in Windows or MS-Dos and then set up and use that
drive with the BB? That might be a good work-around for the formatting
issues. Note that I'm referring to a low-level format only.
Thanks,
Larry

I want to make a nice 8-bit setup to mess with at some point. I've got
an XE:VGS lurking, I'd like to upgrade the RAM if possible, and
obviously find disk drives and the like.

I can always run an emulator, but I like having functional hardware.

Richard

Hello All,

This week (until 7 April 2006) I will be offering the DGS Atari 8-bit CD-ROM
(commercial and PD combo) for the special price of $5 (2pounds for UK
buyers), which is a $3.50 saving on the usual price. This price includes
SURFACE MAIL shipping to any country (2nd class post for UK buyers). This
offer is for those of you who want to save some money, but don't mind
waiting as surface mail can take 60+ days!

If you don't already know, the CD contains most of the DGS commercial Atari
8-bit products and the full DGS PD library (191 double sided disks). The
commercial products include the PPP products QUICK programming language, SAM
80-col GUI (no extra hardware required), and games, along with the
Digi-Studio digitized music package, all 26 issues of the DGS newsletter,
and more. All products are in both DCM and ATR format, and have PDF versions

of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8-su.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

There's plenty of background info on DGS on the main part of the website.

Dean Garraghty

I have used optical scsi, any older Apple external 50pin scsi, conner,
seagate, the list goes on, but to get a good format and partitions all the
hard drive geometry needs to be known. And proper termination with lun pins
properly selected, and a short scsi cable. I have not had real good luck
with any of the newest 60 and 80 pin drives needing an adapter, nor any
drive that can be selected above 7 drives.. SyQuest drives are my favorite
with optical removable disks.

>
I don't think that I have every had to low level format a drive. I just
setup partitions and then with MyDos I -init after setting the 0 parameter
for config disk....sector size..etc.. And with SpartaDOS I use FMTDIR.COM
to do the init then copy xxxx.dos to drive(partition) then Type BOOT
xxxx.dos reboot and it is over.. Low leveling a drive can lose important
drive information that only the drive looks for..

Infocom once claimed disk space as the reason they stopped supporting
certain formats. At the time, as I recall, rampant piracy was the
reason given in the magazines I read. No one thought they could make a
profit with 8-bit Atari games. IIRC, Datasoft/Intellicreations were the
last major label to support the 8-bit Atari although SSI lasted until
1988 or so. The late 80s were also the time when C64 production was
taking off. Remember it was the best-selling single model of computer
of all time. (The bugs that "revision B" had didn't help matters. When
I bought a 1027 printer for my 800XL and it didn't work...I returned it
to the store and got a Commodore 64. I didn't find out until years
after that the printer needed like 10-15 minutes to warm up due to bugs.
  When I bought the printer, the salesperson made a point of commenting
it could be returned. Obviously, I wasn't the only one who had a
problem with it.) I recall lots of C64 software was cheaper than, say,
Apple II titles by $5 or so because more units were expected to sell.

Also, since conversions were often done "out of house," there was the
matter of finding people willing to convert something when they might
have felt their time would be more profitably used on another platform.

Of course, replacing an Apple II's processor with a faster processor
won't do anything to accelerate it.

The problem with using a 65C02 in an Apple][+ has to do with setup and
hold time differences, and some liberties taken in the Apple II design.

Fine thing. I had one with the printer cable. But it's dead.

Is there any chance that Bernhard Engl would release the layout and
software for this thing?

Bye Jochen

I agree. I have heard many times that people think putting a faster CPU in a
II is going to speed it up. Most people don't realize the clock works
externally.

Good thing is: this already happened :-)

Bernhard Engl gave permission to ABBUC to release all the documentation
to his products and also to build new versions of the 1050 Turbo
and the Turbo Freezer. I built a highly improved, new version of
the TurboFreezer which is also available from ABBUC. The documentation
on my webpage isn't complete yet but I'm working on it.

You can find the documentation to the original products in the
ABBUC infothek (most docs are in german, but this shouldn't be
a too big problem for you, I guess :-)

http://www.strotmann.de/twiki/bin/view/Infothek/1050Turbo

so long,

Hias

> -Larry

Hi, Larry. It is an 800 replacement OS, but it was meant for XL/XE machines so the rom file must be built in the same order to match the way the standard XL OS was put together as a 16k rom. A flat out copy from $C000 thru $FFFF wouldn't include the self test area code (and there is some in XL Boss) but would include the hardware registers which are not wanted in a rom file anyway. On the 800, $D800 starts with the math pack code so at first glance one could just (K) Save memory as a file, $D800 thru $FFFF in DOS 2.0 no less, strip the six byte Atari file header, and have the complete 800 OS - the size is just right for that range at 10k exactly. The ATARIOSB.ROM file as used in emulators for the 800 OS does start with the math pack and is exactly 10k in size as well, and that is the advertised size of the 800 OS. BUT then you can read page 107 of Mapping the Atari where they say that there is some code at $C000 thru $CFFF in the 800 and I have seen it, but just how it got there from only a 10k rom is beyond my full understanding at the moment.

I have not been contacted by RetroJess who seems to have left the thread, but by another who does not post in newsgroups and left XL Boss V1.0 and XL/XE BossII V2.0 images for me to spread around. Send a requesting email to lee_454*AT*yahoo.com with BOSS as the subject and I'll attach them to a return email or other email address specified in

the request email, you too Ron and/or anybody else. Anybody care to host these? Please? Yahoo email is no fun at 14.4 dial up.

Was there a Boss OS for the 800? Seems like there might well have been, but I missed out on the early Atari days and don't know much about what was ever offered for the 800. Anybody? The saga continues...?

I also have found a film canister among a rather large batch of 800 stuff that has omnimon 4k written on the side of it, inside is a 2732 eprom with omni written on it, and from the code yet further inside, it appears to be OmnimonA1 from 1983 for the 800? I don't know if there is supposed to also be an A2 or B1 rom for that matter, but if you want an image file of this one, just ask for it too. Again, anybody.

Lee

In view of my difficulties in trying to find a modern SCSI drive that worked properly with my BB, I decided to take another path -- and it paid off! I'm now using a Toshiba MK2110MAT 2-1/2" laptop drive with my Black Box. But that's IDE! Yes, and to make it work I'm using an

Acard AEC7720U (narrow scsi) HD adapter that translates the IDE signals
into SCSI-speak. I've tried several IDE drives so far, and they all
have setup easily and worked well. I'll write more after I've done
more experimentation -- I see no reason why other IDE devices should
not work as easily. But note this is IDE not ATAPI. I believe they
have another adapter for ATAPI. My noisy (death-rattles?) SCSI HD is
now replaced by a "barely whispering" laptop drive!

I have done exactly that on my SyQuest 200 meg SCSI 2 drives with
removable cartridges. I used an Adaptec AHA-1520B ISA card in this
older PC clone with Bart's SCSI tool (floppy boot) to LL format and
then test/zero wipe the cartridges. I believe but am not sure that his
program also gives explanatory 'sense' error texts but the program
first has to mount the drive before you can get to that info section.
Neat deal is the sector copier that allows for full cartridge cloning
in 6 minutes.
Bart's ScsiTool
http://www.nu2.nu/scsitool/

IIRC I never did get ANY drive LL formatted using the BlackBox tool for
that purpose. My old SCSI 1 system would 'hold' the 8bit's boot until

the hard drive was up to speed and mounted and then go ahead and allow
the 8bit to boot. These SCSI 2 drives won't, if you try to boot the
8bit while the drive is still winding up you won't boot from the hard
drive. I suspect that SCSI 2 is probably the highest SCSI version that
will work at all with the BlackBox?

Wow, this is great news. Now I know why I kept the dead board of my
1050Turbo.

Jochen

Good find! I wonder if this same approach would work with an MIO?

You should try to do that with the hardware of this era. They'll have
a good laugh when somebody walks in to the store and says "I bought
this new printer for my pc and it doesn't work with windows 95. I want
my money back" :)

Hi Thomas-

> I wonder if this same approach would work with an MIO? <

Unfortunately, probably not -- the reason is the 256-byte sectors
needed for the MIO. But I did contact Seagate perhaps a year ago, and
their tech told me he believed that virtually any SCSI drive can be

made to read 256-byte sectors if you are willing to go at the drive with the proper software. Bart's SCSI Tool (mentioned here in another recent post) may allow you to do that. I've never used it, but have seen a number of posts that say it really works well. So that potentially means that there are a whole lot of SCSI drives that can be used with the MIO, and not just the scarce-as-hen's-teeth MFM drives and a very few Seagate 225N's that would format out with 256-byte sectors.

Maybe sometime I'll get out an MIO and have a go at it with BST -- then again, that sounds like a lot of work considering I still have a couple good MFM drives...

Hi Roy and Lee-

Thanks to you both for your helpful replies. As you can see from my more recent post, I got the system going with an IDE/SCSI bridge card.

I have formatted older SCSI I and II drives with the BB formatter, but just had no luck with more recent drives. As a matter of fact, most of them would not even accept the drive configuration data to sector zero. I've never tried a wide SCSI drive, but I'm pretty sure that you would need a wide to narrow converter with high-byte termination. That causes the controller to see only 50 pins -- just like it's a narrow SCSI device. I was not aware that some SCSI drives are low-level "pre-formatted" just like IDE drives. That's good info to know.

I also have not used Bart's SCSI Tool, although I'm familiar with it -- that might just be the key as goes SCSI drives and the BB. But since IDE gives one so many more options, I suspect my BB has seen its last (real) SCSI drive. Oops, not quite true -- I still use a SCSI Zip drive for backups. And in truth, the ZIP drive is almost as fast as a regular HD when used with the BB.

Anyway, this has been rewarding, especially to be able to use an extremely quiet, space-efficient, +5-volt only HD with the BB.

Cheers,
Larry

Based on the articles in ANALOG and Antic:

http://www.cyberroach.com/analog/an25/xlboss.htm

http://www.atarimagazines.com/v3n10/productreviews.html

I get the strong impression that there was no BOSS for the 400/800. The way the reviewers describe it (the ANALOG review is far more informative than the Antic review), one of the main points of the XL BOSS seems to have been to restore compatability with the 400/800 OS.

Richard,

Satantronic has memory upgrades using a simm. I've not built one of them, but it looks fairly good.

I'll agree with your strong impression after reading the info at your
links, thanks.

Ross Hartley has begun hosting these two files AND the documentation
for them as well, so everybody who wants a copy get on over to Ross'
Little Atari Page and grab them. Thanks, Ross.

Folks, we're gearing up for another round of Final Frontier 2 here at the DarkForce! BBS. We're looking to recruit more players. If you've never played FF2 before, you're in for a real treat. I'm posting the Intro here, so you can get a "feel" about what the game is like. Please be sure and read the Documentation when you play!

Final Frontier II Introduction:

As I looked up from my comm display at the alien with discolored black and green splotches all over his face, I felt a wave of pity run deep within my bowels. The tears ran down his cheeks as he sat, shaking, in the plaid Naugahyde seat beside me, slowly telling me his story.

 "It was HORRIBLE," sobbed the broken humanoid." I knew I had the intestinal fortitude to handle it, being descended from Terran kings, but the atrocities committed in the FINAL FRONTIER war were just too hard to bear; especially those in THE DEAD GODS sector...that rebel DARKCHYLD's home turf!!"

 'Kings? What?' I thought. I put the comm on auto and leaned back into my chair, fixing my full attention on his story.

 "It all started in the general assembly right before the war," he said.

"The Satharians were miffed because of Ted Turner XXXIV and his holographic

imaging colorization of something called 'I Love Lucy.' I think it had something to do with a red-haired puritan axe-murder. Anyways, distribution in the outer-rim was poor, and the Saths were literally shedding skin over it."

He leaned back in the chair with a gracefulness I had not seen in ages, picking up his tea spoon and twirling it with exaggerated movements. Anything to break

"It all seemed like a small interplanetary riot, you know, the kind that never gets any press anymore. Then that goody-goody MORDEN stepped in," He quick snorted and wiggled his nose contemptuously. "He promised the lizards he would acquire the rights to the shows and air them nationally. But instead he packed up the Saths' national treasury, stole the prime ministers wife, knocked off two holoburger stands, and, dear God, slandered the good name of the acquitted sports hero Orangutan Jumper Sampson..."

I shook my head, remembering it well. "And that's when the proverbial guano hit the gliding rotisserie blades..." I said.

"You guessed it," he continued. "Everyone went berserk, buying ships, weapons and other stuff. Interplanetary systems dissolved, governments collapsed, and

all-out chaos ensued. And that was just from the media coverage alone!"
"People started colonizing planets everywhere, trying to get a foothold of power. Dr. Scholl became a billionaire! But the thing about it was nothing was sacred," he said. "People were invading people, taking planets, and wasting each other just for kicks. It got so you had to hide in a sun's corona just to get some sleep."

"But that's when all the new developed technology started coming about," I interjected. "You know, booby-trapping derelict ships, laying mines, massive production of defense installations, trade routes and other stuff."

"Not to mention the illicit beaming of 'Sweatin' to the Oldies' onto command bridges playback consoles," he said.

I shuddered. Truly a fate worse than death...

"And that wasn't even the worst of it," the curly-haired alien said. "What about those distinguished few, ROGUE, SYSOP, MORPH and others; the real nuts! They sneaked around with weird aliases and thought no one would notice...."

"Yeah, some real unholy alliances came about because of this war," I said as I read my tactical display, looking for SPACE PIRATES. " And with the new increased galactic size, there's going to be a LOT more space to hide in.

Suddenly, the ship rocked with an explosion! Red alerts resounded across my bridge. "And shut that blasted noise off!" came a command. From the back of my mind twas some weird English-accented old man's voice. My alien copilot looked at me as if he had read my mind.

"JEAN-LUC!" we said in unison. The alien started to reach under the dash for

the General Foods International Coffees, when another burst knocked him from his chair.

"Darn!" I screamed, grabbing the joystick like it was the last Pina Colada in Tahiti. I targeted the pirates with my newly-installed Photon Cannons, and blew them 10 levels past Hades.

I started to let myself relax, but I noticed something peculiar. The graceful alien had been knocked out of his seat and was being jostled about the cabin . But he was moving now, on his feet, and it looked like he was supposed to be walking forward, but instead he was moving backward.

"Just Beat me, just Beat me...." he murmured.

I started reaching for my hand-phaser, slowly and cautiously. He spun around and stopped so abruptly I thought the gravity simulators were off line.

"You wouldn't happen to have any peanut butter and bananas lying around here, would you?" he queried.

I screamed and hit the floor, grabbing my weapon. But the Prince (God help us) slid over to me like a greased proton beam and wrenched it from my hand.

"So, you figured it out, huh?" said the Prince.

I stared at him, aghast. He just smiled that weird-smile of his; it was like something out of an old beach flick.

"Yeh, it's me. One of my daddy's old fans set me free from the suspended animation chamber. And wouldn't you know it, after my daddy, Michael, and my momma, Lisa-Marie, hid all the Terran currency some years ago after collecting it from owning rights to just about everything (gasp); I'm quite rich! But I thought it would be nice to put some Thriller into your life by stealing your ship."

He started to laugh; it was a ghostly, haunting laugh, and made him throw back his head. I took the initiative and pushed his skinny 80-pound body across the floor, slamming him into the bulkhead. But he quickly recovered, and raised the phaser. Click.

"Shoot!" he exclaimed, wrenching off the battery cover, the SupraVolts falling to the ground.

I sprang forward, slamming my fist on to the escape pod eject button. The small section of the ship he was in closed off and spewed forth into space, taking the demon-spawned love-child with it. I made a silent prayer to a certain bass drum-toting pink bunny.

Collapsing on to the console, I heaved a sigh of relief. I sat up, entered some random coordinates, and warped into space. The war was getting bigger.

It was much more intense. I was going to get my fair share of the...

FINAL FRONTIER II

(Final Frontier I was just a teaser...)

* * *

Think you're bad enough to survive this NEW, VASTLY IMPROVED version of Final Frontier? No longer do you have to wait for the wusses on your board to show up and play. No longer do you have to depend upon your teammates like in S.E.E. (Shameless Plug). Want to see if you are TRULY bad enough to hang with all the pros? It's a whole new game, networked and armed to the teeth...

You know the old story...

"This is where you come in to play. You have been given a ship
and some vessels; the most that your government could give you in
this deep space area. You must, either by yourself, or with the
help of others, control at least 400 of the planets in the Outer
Rim to win this war. By colonizing and fortifying planets, you'll
be able to manufacture more goods and ships for yourself. You should
expect aggression from other ships and planets, and should not hesitate
to attack others to reach your goal of 400 of the planets. Good luck.
You'll need it.

Now live it! An expanded, networked galaxy awaits you, along with many players from all around the universe. So get ready, read the docs and new features, then let's get down to some serious arse-kicking!

See you out there in CyberSpace, friend...

Try http://www.holyoak.com/atari/8bitcomp.html

There also was an article in the on-line magazin www.myatari.net but
unfortunately, they have been "temporarilly off-line" for a while now.
May issue. I'm not sure about the year, but it has a red cover.

I have two "new" SCSI HDD's here. Both have 68 pin connectors. One is
2 GB the other 4 GB. I'm planning to install them in the CM Stacker
(Big Tower by Coolermaster), along with my CD-ROM and DVD-ROM mechs.
68-to-50 pin convertors are already installed. But I still need to get
an extra cabel so I can hook everything up to the power suppy. And I
probably have to drill new holes in the 4in3 thingy, because I want to
install two 3.5" floppy disk drives, and Coolermaster didn't expect that.

Nice to hear that the SCSI-2-IDE convertors work with the BlackBox. If
you send me a textfile explaining what you did, maybe even with some
pictures, maybe I can add them to my site at www.mathyvannisselroy.nl.

Modern drives will not allow you to LL format the disk. The
manufacturers put some info on that disk (probably which sectors not to
use) that needs to stay on there for the disk to work. If you'ld format
them, this information would be lost. Just use FMTDIR to partition
everything and forget about HDFMT.

CU   Mathy

PS my 80MB IBM HDD is very noisy, but still running after years. I
recently heard that 10 yera old SCSI disks are still going strong, but 3
year old IDE/Atapi disks have been developing errors already.

The M.T.B.F. (Meantime between failure), going with SCSI-stuff, is
factly higher.

Most headache makes me s.m.a.r.t.. :) (what a shit, I finally survived
a 60GB HD which was damaged (due to smart) with an other PC [not one
bad sector"!"])

Could you please send me some more information, I'll try to track down
the issues. Which distribution are you using, which kernel version,
which gcc version, what's your kernel .config, what kind of errors
do you get etc.

The most recent kernel version I've tested AtariSIO with is 2.6.14,
IIRC I used gcc 3.3 (it's a Debian Sarge box).

BTW: If you contact me by email I'll send you my latest development
snapshot.

so long,

Hias

There's SIO2Linux at http://www.crowcastle.net/preston/atari/ that is
entirely in user space, so it should work with any Linux system. It works
great for me, but I've heard reports of problems; I'm guessing that not
all of the SIO2PC cables out there are compatible, so it only works for my

type of cable.

Unless the program is using the RAM under the OS, there isn't really any
reason for it to be fiddling with $d301, so you might be able to patch the
program to stop it from doing this.

It seems like quite a few programs set $d301 to a "sane" state even though
they don't really need to use any of the memory banking features.

Some programs also do it the quick and dirty way (for example
AtariWriter): instead of doing a "LDA $D301 / ORA #2 / STA $D301"
(to switch basic off) they just do a "LDA #$FF / STA $D301".
The sames also often true when programs set the extended memory

banks. Quite annoying...

Yesterday I patched some game files so they can be used with the
flashcart (the flashcart also installs a patched OS in the RAM
under the OS).

So I had a look at Atari Writer Plus: The .COM file has some blocks
with memory location $D301 so the can simply store parts of the
code in the extended RAM. The code itself also contains parts
like "LDA #$E3 / STA $D301".

Changing the software so that it works cleanly with and without
the MyIDE flashcart would be quite tricky, so I just patched the
.COM file so that it will work with the MyIDE flashcart
(and with the MyIDE soft OS). Here's the patched file:

http://www.horus.com/~hias/tmp/ap.zip

BTW: patching file was quite easy. I just disassembled the .COM
file, then searched for all occurrences of $D301 and used a hex-editor
to change some values. Took me 5 minutes or so :-)

so long,

Hias

> newer GCCs, I couldn't properly compile it anymore :-(

I just did a test with a chroot installation of Debian Etch using
Kernel 2.6.15.6 and gcc 4.0.3 and saw that there are quite some
errors when compiling with -m64 (-m32 works fine).

Please contact me by email and I'll send you a fixed version.
I don't have 64bit machines, so I can't test it by myself, all I've
got for now is a nicely compiled and linked 64-bit executable
resting on my harddisk...

so long,

Hias

Hello, all. After toying around with an 8-bit emulator for a while,
I'm happy to say that I'm back, at least one-foot-in-the-door's-worth,

in the world of the XE.

I've started a blog about my new exploits, and my thoughts on returning
to the world of 8-bit programming. Everyone is invited to join in the
discussions (and the projects!) there, should they choose.

Join me at http://atari8programming.blogspot.com

```

Caution is to be advised as David could still bork his hard drive very good. There is a bug in MyDOS where Marslett didn't understand the proper setting for a 'no ramdisk' value as zero and not $FF. The CIO routines then takes Marslett's ramdisk drive number value of $FF stored at $070A and converts it to D1: and the format is ON - Good bye hard drive. Drive 1 on your hard drive system will be formated as a 720 sector disk and not the bigger (up to 655535 sectors) one that you used to have, a real PIA. It happened here twice and now I never have the hard drive write protect switch off unless I'm storing a file on my hard drive. Can I suggest to David that he take a look at my Myrd and Myrd2 ramdisk formatter/autoloader programs? More to the point, the source code for same (myrd2.arc) available on the MyDOS page at: http://www.mathyvannisselroy.nl/index.htm

Hias's code above will work fine IF location $070A contains a valid drive number from 1 thru 9 and 9 only works if it IS the ramdisk, whereas the ramdisk can be any drive number from 2 thru 9. BUT there is a further bug in MyDOS where the XIO format function is broken in that it will NOT accept aux1, aux2 values as gospel and do the format as stated in the manual. It will format the drive specified but only as that drive has been configured prior to leaving DUP.SYS to do either BASIC or assembly programming and/or running of machine language

programs from the (L)OAD function in the menu screen of MyDOS. Mathy Van Nisselroy discovered this XIO bug when attempting to write a TurboBasic program to do all available formats from there instead of using MyDOS's menu methods. His only recourse was to do the format at the SIO level and then write the boot and VTOC sectors from TurboBasic instead of allowing MyDOS's XIO function to do that for him.

Mathy did write to the drive in question a proper configuration block prior to a matching XIO format attempt - still no good. We got the right format but with the wrong VTOC sector, or other odd arrangements including double sided formats with single sided VTOC sectors and vice versa. The manual is simply wrong about MyDOS XIO format functions, it doesn't work as stated always. If the desired format has been preconfigured via O and P options in the menu of MyDOS then it works perfect, otherwise you can get garbage for your efforts. We hope to fix MyDOS so that it complies with the manual in every respect - someday.

(newsgroups have been down here - I've been trying to post this for 3
days!)

First of all, Happy New Year everyone! :-)

We're trying to kick things off right at The DarkForce! BBS, so in the

spirit of the season, we are continuing our tradition of monthly prize giveaways.

This month, January 2006, one lucky Atari caller will win a free subscription to ST Magazine. Also, since its almost NFL playoff time, this months featured game is AFL Football! The lucky winner of this game will receive a $25 cash prize. Slots are limited to the number of teams available so don't be left out. Also, rumor has it the Sysop is playing...who doesn't want to take a crack at bashing the Sysop? :-)

Good luck everyone! :-)

This is as opposed to the 1084s, right? It had stereo sound.

--

If we could only get the C64 music to play with the Atari color cycling, M.U.L.E. Catari would be perfect! If you've never heard the M.U.L.E. music played on a C64 then you're missing out! I will also say that the Atari isn't as second fiddle to the C64 for this type of game when it comes to graphics as the extra vertical 8 pixels don't seem to be missing compared to the C64 and the additional colors are obviously welcomed.

Did something get queued up somewhere for way too long? ;)

Thanks,
Mark

Personally, nothing compares to the MULE music on the atari for me.

Money Making Try It Works!
HELLO, I found this on a bulletin board and decided to try it. A little
while back, I was browsing through newsgroups, just like you are now,
and came across an article similar to this that said you could make
thousands of dollars within weeks with only an initial investment of
6.00! So I thought, Yeah right, this must be a scam, but like most of
us, I was curious, so I kept reading. Anyway, it said that you send
1.00 to each of the 6 names and address stated in the article. You then
place your own name and address in the bottom of the list at...6, and
post the article in at least 200 newsgroups (There are thousands). No
catch, that was it. So after thinking it over, and talking to a few
people first, I thought about trying it. I figured: what have I got to
lose except 6 stamps and 6.00, right? Then I invested the measly 6.00.
Well GUESS WHAT!! Within 7 days, I started getting money in the mail! I
was shocked! I figured it would end soon, but the money just kept
coming in. In my first week, I made about 25.00. By the end of the
second week I had made a total of over 1, 000.00! In the third week I
had over 10, 000.00 and it\'s still growing. This is now my fourth week

and I have made a total of just over 42, 000.00 and it\'s still coming in rapidly. It\'s certainly worth 6.00, and 6 stamps. I was in a bad economic state before I found this article... I didn\'t believe this really worked until I ACTUALLY started getting mail from all over the world... I bought everything I needed... This idea came in the right time exactly :-) Let me tell you how this works and most importantly, why it works....Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions and watch the money comes in! It\'s easy. It\'s legal. And, your investment is only 6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really Works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and 50, 000 or more can be yours in 20 to 60 days. This program remains successful because of the HONESTY AND INTEGRITY of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it\'s a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the 4 easy steps to success: STEP 1: Get 6 separate pieces of paper and write the following on each Piece of paper; PLEASE PUT ME ON YOUR MAILING LIST. Along with your name and address. Now get 6 US 1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a 1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

1) Arik Stephens r.r.2 box 251e St. Elmo, IL 62458

2) Scott Miller 9537 Leyendekker ct. Lakeside CA 92040

4) Tyler Otto 271 Weston Cir apt 21 Vista, CA 92083

4) Rashantees, PO Box 708, El Cerrito, CA 94530

5) Magus c/o Bob Condor 1242 South Portage Rd, RR2 Haliburton . Ont. Canada K0M1S0

6) Jonathan Burnett, 842 E. Co. Rd 60, Mendon, IL. 62351

STEP 2: Now take the first name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR NAME as number 6 on the list. STEP 3: Change anything you need to, but try to keep this article as Close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24, 000 groups) All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again and again. PLEASE REMEMBER that this program remains successful because of the HONESTY AND INTEGRITY of the participants and by their carefully adhering to the directions. Look at it this way. If you are of Integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a Good idea to wrap the 1 bill in dark paper to reduce the risk of mail Theft). So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the...1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only 6.00 (1.00 for each of the first six people listed above) Send it now, add your own name to the list and you\'re in business!
---------- DIRECTIONS FOR HOW TO POST TO NEWSGROUPS----------

STEP 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and Drag your cursor to the bottom of this document, and select \'copy\' from The edit menu. This will copy the entire letter into the computer\'s Memory.

STEP 2) Open a blank \'notepad\' file and place your cursor at the top of the blank page. From the \'edit\' menu select \'paste\'. This will paste a Copy of the letter into notepad so that you can add your name to the List.

STEP 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you\'ll always have this file to go back to.

STEP 4) Use Netscape or Internet explorer and try searching for various Newsgroups online forums, message boards, chat sites, discussions. (Just example you log on any search engine like yahoo.com, google.com, Altavista.com, excite.com then you search with this subject millionaire Message board, or money making message board, or employment message Board, or money making discussions, or money making forum, or business Message board etc. You will find thousand & thousand message boards.)

STEP 5) Visit these message boards and post this article as a new Message by highlighting the text of this letter and selecting paste

from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a Particular group, click the post message button. You\'re done with your First one! Congratulations...THAT\'S IT! All you have to do is jump to Different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200 That\'s it!

You will begin receiving money from around the world within Days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. REMEMBER; PLAY FAIRLY and HONESTLY, and this will really work. Good Luck to you all!!!!!!!!!!!!!!!!!!!!

You betcha - although I can't explain why, whenever newsgroups goes down
from my ISP, when they do finally come back up, the first 1-2 times I
access the newsgroups I'm subscribed too, well, old, old messages get
reposted.

This is using PAN under Linux.

Anyone have any ideas as to why? I've had it happen several times. :-(

Possibly, after your ISP sorts out the usenet problems, they fiddle with
the message ID counter for each group, as a safety measure. Pan cannot
know this, so continues with message ID's it has, resulting in the
retrieval of old messages.

Very interesting. So I suppose the easiest method of verifying the presence of D9: as a ramdisk would be to try and get a directory listing. If it errors out, abort format. Since MyDOS initializes the RD and it appears, at first, as a disk with 65535 sectors, I will at least be able to read that.

What do you think?

Hi

I'm looking for a binary EPROM image of the elusive XL BOSS by Allen MacroWare.

Please do not confuse with BOSS XL, the GUI by Mirko Sobe.

Anybody has it?

Regards

This March I'm celebrating my Birthday! If you want to bless me, I'm
trying to raise Capital to buyout an Atari Dealer of all his Atari goods!
So give me your Atari business, send all Atarians Marching my way and help
save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled
from all items NEW in BOX from all my other catalogs made up of Hardware,
Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns
of text width it will be 80 column width, Most entries will be 1 line each
and sorted alphabetically by title. You'll only find my NEW items in this
catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org	Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm	Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm	Ben's Atari Birthday!
http://www.aracnet.com/~atari/wantlist.htm	What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

ATTENTION Atari customers. I'm buying out an Atari dealer, cleaning him out! I've bought over 480 pieces of ST Software. Mostly Games! I need to make room for NEW inventory and raise the capital to buy him out. If you would like to help save Good Ataris from extinction, buy ANY Books or Games/Software in my Classic Atari 8 Bit and/or Atari ST Catalogs and get 20% off! E-Mail Atari@aracnet.com or Call Ben at (503)256-9974!

http://BensCatalogs.Atari.org WebSite & Atari Catalogs!

http://www.aracnet.com/~atari/8btbooks.htm   8 Bit books catalog!
http://www.aracnet.com/~atari/8bt_soft.htm   8 Bit software catalog!
http://www.aracnet.com/~atari/specials.htm   Details on Sales!
http://www.aracnet.com/~atari/stbooks.htm   ST books Catalog!
http://www.aracnet.com/~atari/st_soft.htm   ST software Catalog!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

As a matter of fact I have a C64 emulator for my PSP solely for the purpose
of playing M.U.L.E. on-the-go. Overall I would have to say the Atari
version is my favorite though; graphics, sound, everything. I am not
knocking the C64 version at all, but I think the Atari version is much
better in all respects. Hey, to each his own; I've met some people who
think the NES version is the best, surprisingly enough.

If I remember correctly, MULE was one of the few games that took advantage
of all 4 joystick ports on the 400 and 800 and allowed 4 simultanious
players.

I liked "Floyd of the Jungle" for the same reason.

Yes, it is compatible electrically, and no,
the WDC is in a PLCC package.

Huh? I have 40 pin DIP WDC chips. I've bought 40 pin DIP directly from WDC.
I haven't directly tested the WDC 65C02 in all II's but in a IIe it should
work just fine. I had problems getting some 65C02's to work in the IIplus. I
seem to remember RAM not liking it.

> Can MOS 6502 be replaced with WDC65C02 Microprocessor?
> The WDC can fit with Atari 8bit family and Apple II family...

Apple II -> yes

Atari 8 bit -> no! (at least not as a simple replacement)
The Ataris use a modified 6502 - called 6502B. It differs in only one
feature from the normal 6502: It has a special interrupt line which the
graphics processor ("ANTIC") uses to stop the 6502 and gain DMA access
to the RAM.
The 6502B is therefore not pin-compatible. You 'd have to build extra
circuitry to add this interrupt line to a "standard" CPU like the 6502
or 65C02. And if you have to do that you may use a powerful CPU like
the 65816. (Then a plethora of other problems will arise - like system
timing. But that's another story .)

C64 -> no! (I know you didn't ask ;-)
The C64 uses a 6510 which is a 6502 with two additional registers (at
addresses $0000 and $0001) to control the memory management (disabling
the system ROMs, for example).
So its even more complicated than with the Ataris - which didn't stop
people to build accelerators, though...

bye
Marcus

Thanks. I don't think that will work like you want it too. MyDOS will
pull a successful directory on SpartaDOS disks which usually results in
2 or three screens of garbage, a honk or two and then finishes up with
an impossible free sector count displayed at any point on the screen.
Yet register Y returns from the CIO call equal to 1 which means 'good'
so how would you know a bad one from a good one in machine code? If it
DID error out then I'm thinking you would want to format so the logic
you posted above is backwards? Don't feel bad as that is not an
unusual mistake to make when it comes to machine language in my
experiance. I don't think it will ever error out even with a ramdisk

full of garbage. And with the wrong configuration for the ramdisk in use as well.

If you are looking just to insure that your ramdisk is drive 9 always, you could place that value ($09) at $070A and just proceed with the rest of your program. When you then format drive 9, MyDOS will sense that drive 9 IS your ramdisk and proceed with the special code just for the ramdisk format at that point.

MyDOS doesn't initialize the ramdisk, it could be configured to use one and show one as valid and available when booted on a stock XL. If you try to use it however, DUP.SYS will be overwritten and then you'll crash, but you might not know it even happened because MyDOS will then attempt to reload the DUP.SYS file from any and all drives in succession eventually succeeding from your floppy and no appearent harm done. The configuration of the ramdisk is totally a function of the (O) Configuration menu option and then only good for the machine that the option was run on. In order to save this configuration you MUST then do (H) Write DOS files menu option to drive one. THEN and only then MyDOS knows what kind of ramdisk you got when you then boot that disk on that particular computer. But the current configuration for your ramdisk always comes from the last time you ran the (O) Configuration menu option and nowhere else. MyRd2 fixes that problem and insures a working ramdisk configuration buy using code modified from those DUP.SYS ramdisk configuration routines.

I couldn't figure out any way to test for a valid pre-existing ramdisk if that is your goal. I had to cheat and make it a test for if MyRd had run before in order to prevent a 2nd and unwanted format of the ramdisk. And that was the only solution I could come up with. If I knew exactly what you wanted to do and when it was supposed to happen maybe I could help better? MyDOS is full of these kinds of twists and turns that seems to be built in such that you can't get there from here. Add to that, I don't know what you want to happen and we could go in circles for a long, long time. If you're just looking for basic MyDOS ramdisk info that's fine too.

Lee

Mostly right. The early Atari 800 used 6502B and the later 800s through the XEs used a 6502C. Only the processor board for the early 6502B has the extra circuitry you need to use a 65C02.

I have a 65C02 in one of my 800s. In my experience it does nothing but a little power saving unless you write your own code in assembler. I seem to recall my code was ~5% shorter using the extended instruction set. I've got in debates with people about the value of 5% tighter code. I think the ~5% speed gain you get is not significant but freeing up 500 bytes in the OS ROMs would allow you to add some nice features.

There was also the 65808 that is supposed to work in early 800s. This is a 16 bit internal/65816 pin compatible with the 6502B. I tried for a year to find one of these in every surplus shop in Silly Con Valley w/o sucess.Maybe we could scrape together a million bucks and get WDC to make another run.<grin>

Just a general comment to the group. Most people don't want to learn a new language like Action! or assembler. People that don't solder don't want to learn at this stage of their lives. What people seem to really want is a new power supply that will let their Atari run like a gigaHz P4.

This was because of the older ram chips' response time, correct? If
you wanted to upgrade the ram chips to faster ram, would that work?
Would the same go for a //e as well?

Not sure, I never had to go any farther since Rich Dreher made the CFFA work
on a IIplus. If I remember correctly, the RAM chips actually got hot with
the C02 installed! It is entirely possible faster RAM would do the trick but
it would just be easier to find an accelerator on eBay. Why risk frying a
board.

Yeah, the accelerator does the trick.

I actually use my SpeedDemon in my IIe for a little
added speed. :o)

> Atari 8bit family and Apple II family...

Yes and no.

You will lose compatibility with programs that use the 6502's "illegal"
opcodes. That's less of a problem with Apples since the company switched
to 65C02 by itself before too many programs with the illegal opcodes
were on the market.

For other system architectures that stayed with the NMOS 6502's longer
and/or used lots of cycle-counted raster beam racing code, the problem
gets bigger. Examples would be the Commodore and Atari computers and
consoles.

And of course there is the problem that other people mentioned already:
Those systems that use NMOS 6502 *derivatives* (such as 6502B, 6507,
6510 etc.) can't use the 65C02 chips without some extra circuitry.

What type EPROM does basic use?

Does anyone have a dump of the XEGS OS/Basic/Missile Command ROM and what
type EPROM it uses? I have an XEGS with a bad ROM.

TIA

Thomas

Why don't you just send along a couple of the magazines, and let
the new owner have the "fun" of typing the programs in himself...
just like you did all those years ago???

Interesting thought, but unfortunately I threw the magazines away years
ago. Well, all but the copies where my own article appeared. I hadn't
looked at them in four years, and they were taking up valuable space.

I didn't type them in because it was "fun." At first it was because I
was using a <shudder> cassette system. Later, when I finally got my
first 1050, I was too cheap to get a disk subscription!

Well, for the quick-and-dirty, I thought I'd take advantage of the OS's
draw routines. :)

But yeah, it'd be good to actually go through and write some line
drawing routines, and see if I can get 'em going faster than the OS ones. :^)

I am wondering if an Atari can upgrade to 1MB. 1MB SIMM, 8bits, (IBM simm
Style) can fit with Atari XL/XE? we use Axlon adapter? Can 1MB SIMM be added
in Axlon Adapter or other Axlon compatible?

Jack

After months of playing this game with pencil and paper from local
newspaper. I have found in my browsing the Atari internet sites. Sudoku
for the Atari 800. The emulator that I use most often shows this Puzzle in
dazzleing color---- now to reconnect my 800xl. My thanks to xxl. Found in
the latest files column. Lots of other interesting items here also..
http://www.atari8.info/dodajkomentarz.php?news=315&lang=en
Now I'm going to make a new MyIDE image for my unused cartridge. Or maybe
just download to my KMK hard drive.

Awhile back I started writing a graphics library in C for cc65. I posted
what I had to Atariage. It would be nice if we had a good general graphics
library for the Atari platform in cc65.

There is a standard TGI library for cc65 that is cross-platform and the
Atari platform still needs an implementation. (in case you are looking for
something to do with cc65. ;)

I haven't seen any 1mb simm upgrades for the 800, but there are several for
the XL/XE computers floating around on the net: Mathy Nisselroy's, Bob
Woolley's and the Satantronic one, off the top of my head. All these use
the XL method of banking memory into $4000-7FFF controlled by $D301.

OK I have the ROM image for the XEGS, I just pulled it off of another one I
had after desoldering the chip.

The XEGS uses a 27C256 EPROM.

I ordered BASIC from Best as I understand it is masked.

Search for PIO2PC. It's like SIO2PC, but uses the PBI. Only bad thing
about it is, that the code from the device isn't switched in nicely, but
simply replaces the OS.

CU   Mathy

PS check out my site. PIO2PC is on it.

I noticed TGI, and noted the lack of Atari support. I'd love to help...
when/if I can find time! 8^o

Looks like I'm a little late.

I'm not sure EPROMs can be adapted so this easily but I'm using an SRAM
in place of the BASIC ROM.

The one major difference in the pin configuration was that A12 for the
BASIC ROM occurs where CS normally would be. I just lifted that pin and
pulled A12 from the OS chip.

Oops, brain cramp!

I forgot, A0 thru A7 are reverse ordered on the BASIC ROM vs an EPROM.

This is not a problem using an SRAM but an EPROM definitely would not
work.

Anybody got a copy of the Smart Terminal software that came with Supra
Corp's 300 baud modem? Just picked up said modem, no disk with it.
:^\

Thanks!
Rob

Real foggy yet again.

If that is the modem that plugs into the joystick port, practically no
one used Smart Terminal with it. If you want it as a collector fine.

I think most people used a version of Express written for the Supra or
with a separate J/S R:handler. There was something wrong with Smart
Term, like it was sold as allowing U/L and D/L but didn't really have a
compatible protocol built in. I think even HomePak could be made to work
with the Supra.

If you pick up one of the J/S R:handlers from umich you can even use
some of the old BASIC terminal programs. I think one even allowed 450
BAUD from either the Supra or Volksmodem but you needed something on the
other end that would accept that BAUD rate. Pretty standard
implementation of the handlers, just rename them AUTORUN.SYS on a boot disk.

Once you get the correct R: handler, you can
use a number of term programs.
MPP was the 300 baud modem that connected to the joystick port.
You will have trouble connecting to any service though, none support under
about 9600 baud.
Like Rick said, it is probably best to name the
handler AUTORUN.SYS so that the handler gets installed properly.
What you trying to do with the modem? Have you gotten the correct R:
handler? (I forget
the Atari 300 baud modem number, but it used a T: handler.)

How can I reconfigure the 800's System Reset to work more like the
Reset on the 800XL? As it stands now this function just hangs the 800
most times that a Reset would be desired. Both the 800 and 800XL
initiate a Warm Boot when Reset is pressed but it works better (i.e.
more reliably) on the 800XL.

Second question, is there a way to design a Hard Reset that doesn't
interupt main power.

The reason I ask is I occasionally have need to connect the 800 to a
very old television via the RF cable. When main power is interupted
loud static is heard on the television. It's very annoying. I'd like
to be able to perform a Reset without listening to that noise.

Could I just interupt Vcc to the CPU? or to CPU + Antic? Would either
of these work and would they prevent the static noise?

I believe Reset just generates a NMI on the 800, it does not actually reset the cpu.

On the XL/XE the reset key pulls the /RESET pin of the CPU low while it is pressed. You can use a normally open pushbutton, connecting one side to the CPU /RESET pin and one side to ground.

I believe /RESET is pin 40 on the normal 6502.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

RELATED NEWSGROUPS:

This March I'm celebrating my Birthday! If you want to bless me, I'm
trying to raise Capital to buyout an Atari Dealer of all his Atari goods!
So give me your Atari business, send all Atarians Marching my way and help
save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled
from all items NEW in BOX from all my other catalogs made up of Hardware,
Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns
of text width it will be 80 column width, Most entries will be 1 line each
and sorted alphabetically by title. You'll only find my NEW items in this
catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org   Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm Ben's Atari Birthday!

http://www.aracnet.com/~atari/wantlist.htm What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Bill,

Sorry for the late reply, but I have some xio C functions included in the source to my JellyBeans game. The source can be downloaded here:

http://geocities.com/vlastaar/jellybeans/jellybeans_src.zip

The main page is here:

http://geocities.com/vlastaar/jellybeans/

Good luck!!!

Chris

The XL/XE uses a "magic number" sequence of 3 bytes in RAM which it
checks during the reset code. Using this method, it knows if the
machine has powered up, or the user has press RESET (provided that
running software hasn't corrupted the numbers).

For that scheme to work on the 400/800, a customized OS would be
needed, since those machines assume a RESET to be a coldstart, which
will clear the RAM of the machine.

The only condition where RAM isn't cleared is if a "diagnostic"
cartridge is present (some game carts are defined as diagnostic carts,
and do their own power-up initialization).

The best method to have an 800 do a power-on RESET through a switch
would be to have it wired to the RESET pin of the 6502. It has been
done by many people, but I don't have any linkage for it.

If you have the skills for C, why bother using the OS graphics calls.
They are slow and inefficient.

I've written ASM plot/draw routines and they run 5x or more the speed
of the OS routine.
Just use the algorithm described in the OS manual for drawing lines,

it's the best there is.

Also, the OS fill routine is useless, it only does a basic polygon.
Proper fill routines use a stack where co-ords for new areas to be
filled are stored. There is source code for a fill routine (diamond
algorithm, not the fastest, but relatively light on memory use) one of
the old Analog magazines (the one with "Atari Graphics" as the cover
theme).

Hi Rob-
I bought one of those maybe around '84? I'll look through my stuff for
the disk software -- I'm not sure if I still have it. I can still
remember that first download from Compuserve at 300 Baud -- took about
a half-hour to D/L a BASIC utility! -Larry

Over the years, several people have posted that they were attempting to
transplant the C64 SID chip into an A8. Is anyone aware of someone
actually successfully doing it? I must admit that I love SID music.
It actually plays very well on the VICE emulator, but having it in an

A8 would be quite cool. -Larry

You want a Commotari computer, don't you.

qWhen you wrote this, I came to think of the idea to transplant
at GTIA chip to a Commodore 64.

So long as it has the A8 operating system, DOS(es), Screen Editor, and
Languages. ;-)

But seriously, seems like a SID cartridge would be fairly feasible --
with direct output to a mini-amp.

Ignore it doofus. It was a mistake. I deleted the post from the news
server when I realised I had posted it, obviously it started to get out
already.

Um, why? Other than number of colors, I can't see a single advantage
over the VIC-2, but even the color issue is negligible with IFLI.

You're posting from Google groups, idiot. You *can't* "delete it from the
news server."

Hi, Roy;

Do you have any instructions or hints and tips from experience?
I grabbed this and have no success; It loads nicely with a
colorful screen
and then the playfield. Option and Select choose mode and level
and I
can put 0 to 9 into the top corner box. Downhill from there;

cursors and
Return have no effect and Start generates pink WA T (missing I)
and lock
up requiring reboot.

RetroJess

That mod from Clarence's page is good, but there is a slightly
easier
one around somewhere. I have a dot matrix print out from a long
ago
BBS that uses only the momentary switch and one resistor IIRC. It
was a snap when I installed it.

Hi RetroJess,

It sounds like you got a bad download. Press   START then wait for the game to generate the .... GIVEN numbers. ..(1-2min). depending on level you started with... the wait should be gone and number grid up and ready to be filled in   I haven't tried to get it to solve any newspaper puzzles yet.. but the cursor keys are normal right/left up/down when you place a number just press the number key. I think there is a doc file readme with the zip..

Oh yes, Jack, more of this, we all here like that sort
of cock length comparisons... <sigh>

What the hell is a XF551 anyway?

Oh I geddit, it must be an Atari drive considering the cross-post.

I have the following classic 8-bit equipment, all of it looking for a new
home:
    (2) 800s with pwr supplies
    (1) 400 with pwr supply

    (4) 810s with pwr supplies
    (2...I think) 850s with pwr supplies
    a pile of misc parts and test mdules

I prefer to sell it all at once. Drives will likely need alignment. Last
time all powered up and worked well, but that was several years ago. Buyer
pays all shipping in cont. U.S.

Please correct me if I am wrong but doesn't that "hard-RESET" circuit

interupt main power?

Actually, the switch connected to the /RESET pin appeals to me. A Cold
Start is fine as all I want to do is select a new image in my homebrew
multi-cart and restart, without killing main power.

Worked fine for my in Atari800 on Linux, but that's set up for PAL.
My Atari 800XL currently has an NSTC ANTIC in it, and it didn't get
very far beyond the (pretty!) title screen. Started flipping out. :^/

Must be PAL only???

> As promised:

Thanks! I've been able to get DRAWTO and XIO-based fill working
(again, just for fun... to bootstrap myself and get used to cc65'ing
things, more than for any actual real use).

However, for the LIFE of me, I cannot get PLOT (aka POSITION & PUT) working!

```
void _plot(unsigned int x, unsigned short y)
{
#define iocb6 (*(struct __iocb *) 0x3A0)

  POKE(84,y);
  POKEW(85,x);

  iocb6.command = 11;
```

```
  iocb6.buflen = 0x0000;

  asm("lda $02FB");
  asm("ldx #96");
  asm("JSR $E456");
}
```

What the heck am I doing wrong? It ends up being a No-Op!

I created a little C version of the "American Flag" plot/drawto demo
from the Atari BASIC manual, and it comes out all wrong. :^/

(I can post my full source, if anyone cares, but the above snip is what's not
working, so far as I can tell!)

Thx!

Take a look at :

http://search.ebay.com/_W0QQfrppZ50QQfsooZ1QQfsopZ1QQrdZ0QQsassZrescueonfractalus

I'm giving up business and selling my collection.

Most of the games are for ATARI 2600, but there are some ATARI 800
XL/XE cartridge and disk games, too.

I can sell without ebay, too.

MG

Hey Roy;

Thanks for the reply; tried another capture; same results.
BTW it is a small .zip containing only the executable,
 'soduko.xex' with munged extension...

Saw Bill's post also... are you using PAL? I am NTSC.

-RetroJess

No, Steve;

When done correctly, it just forces the system to restart as if
the power had been cycled. The OS routines clear normal RAM
areas and leave any extra RAM containing virtual disk info
untouched. This and avoiding a power shock to the chips are
why they were devised. It does look similar to a power cycle
as the screen goes black when the process begins.

If you are in control of the system with access to Basic or DOS,
you can always do a X=USR(58487) or load a simple binary file
with a JMP $E477. These jumps to the cold start vector are not
available developing apps in assembly where bad code can leave
you totally locked up in never never land.

Can you save the assembler source code or do you just get a .obj?

bill@newbreedsoftware.com (William Kendrick):

>However, for the LIFE of me, I cannot get PLOT (aka POSITION & PUT) working!

I don't know that I can be much help, since I have never used it. I did some searching through the usual reference manuals, and I couldn't find any notes about how to do a plot with CIO.

```
>void _plot(unsigned int x, unsigned short y)
>{
>#define iocb6 (*(struct __iocb *) 0x3A0)
>
>  POKE(84,y);
>  POKEW(85,x);

>
>  asm("lda $02FB");
>  asm("ldx #96");
>  asm("JSR $E456");
>}
```

Does the OS plot routines expect to see the character to be plotted in the

A register or in one of the IOCB bytes?

Based on an Insight Atari article on the subject, it sounds like
the A register:

  http://www.atarimagazines.com/compute/issue89/Insight_Atari.php

;
;
;PUT channel,byte
;

```
;Parameters: A register holds byte to output
;                X register holds channel number
; On exit: Y register holds error code
;
PUT
TAY                     ; save the byte here for a moment
LDA #0
STA ICBLL,X             ; $0000 to length
STA ICBLL + 1,X ; as noted last month
LDA #11         ; the command value
STA ICCOM,X
TYA                     ; data byte back where CIO wants it
JMP CIO
;

;
;PLOT x,y,color
;
; Parameters: A register holds color
;                X register holds x location
;                Y register holds y location
; NOTE: not for use with GR.8 or GR.24
;
PLOT
 STX COLCRS             ;see my August column
 STY ROWCRS             ;these are just POKEs
 LDX #$60       ;the S: graphics channel
 JMP PUT                ;color is already in A
;

From the .s file, here's the assembly for my "_plot()" function:

```
; ---------------------------------------------------------------
; void __near__ _plot (unsigned int, unsigned short)
; ---------------------------------------------------------------

.segment        "CODE"

.proc   __plot: near

.segment        "CODE"

        ldy     #$00
        lda     (sp),y
        sta     $0054
        ldy     #$03
        jsr     ldaxysp
        sta     $0055
        stx     $0055+1
        lda     #$0B
        sta     $03A2
        lda     #$00
        sta     $03A8
        sta     $03A8+1
        lda     $02FB
        ldx     #96
        jsr     $E456
        jmp     incsp4

.endproc
```

Thanks!

Heh, yeah, in that case, the C=64 is then beat by Atari's HIP, RIP and
ColorView modes. ;^)

I guess if you want to solely use your computer for static images, and
give live with a reduced resolution, the Atari graphics would be
superior as IFLI does flicker depending on your monitor. But if you
want multiple bi-directional multi-colored sprites, more available CPU
cycles and higher usable resolutions, then you'll probably want to stick
with a VIC-2.

Not trying to start a flame war here guys, I like both machines. I'm
growing rather fond of the Atari's disk and peripheral system, as a

matter of fact. But the SID and VIC-2 are just better in my opinion
than the graphics and sound in the Atari's.

> > ...
> But the SID and VIC-2 are just better in my opinion=20
> than the graphics and sound in the Atari's.

The Atari was in a way a generation ahead of its=20
competitors. The visual impression of the 256 colour=20
mode was somewhere between the 8-bit generation and the=20
16-bit computers released in 1985.

But I agree the VIC II chip was fantastic and with=20
regard to use in two dimensional arcade games, better=20
than the Antic/GTIA.

To return to the original question, if it would be=20
possible to transplant the SID chip to the Atari, my=20
suggestion is that extra hardware logic is added to=20
be backwards compatible with POKEY calls.

Hardware logic to translate addressing, read and=20
write operations for the POKEY to SID operations. To=20
get four sound channels, two SID chips would be=20
required. With clever mapping of POKEY operations,=20
most Atari games would work.

Then a software utility to change the characteristics=20
of the emulated POKEY sound that the SID chips=20
produce. For example, the waveform could be changed.

Anders

I don't think using the SID on the ATARI would be such a big deal, for example Atari put it's POKEY custom chip in Atari 7800 carts. I suppose an Atari cart could be rigged up with a SID style chip as well. A custom cartridge add on, that would need custom handlers etc.. to access, so POKEY compatible software would still work 100%.

Something like this would prob take a lot more work then it is worth. It would only be useful for playing SIDTUNES, since not enough people would ever own one to warrant a home brew SID/ATARI game.

If you were going to add a new sound cart, why not take a sound blaster chip or something like that? Or if you insist on retro modding your 8bit, you could prob cook up a rom cart that could host a PAULA chip from the Amiga. That would be cool and somewhat fitting since Paula is Pokey's direct descendant.

As far as Commodore vs Atari custom chips. The Atari has more colors and the Pokey does video game sounds (like explosions/lasers etc..) better (largely because Pokey's was used in many Atari arcade games). The Commodore 64 has more sprites w more colors and does instrument style sound better. There are advantages and disadvantages to both platforms (for example Atari is over all faster both cpu and definitely disk access, the commodore has more colors in it's hires mode) but in the end there were lots of ways to get around the hardware and squeeze what you needed into either platform, so it comes down to a matter of opinion. Afterall they were both outdated 20 years ago! 20 years ago the Amiga vs ST debate was in full swing.

Anyone know where I can get some SIO cables or where I can get the
connectors so I could make some?

Thanks in advance.

Yes, that would be possible. You could, for example, built it
into a cartridge. This way you'd only need the PCB, a SID,
and a few additional parts to get a standard (Cinch) audio
output.

> my
> suggestion is that extra hardware logic is added to
> be backwards compatible with POKEY calls.

This isn't possible at all. SID and POKEY are just too
different.

so long,

Hias

>
> Based on an Insight Atari article on the subject, it sounds like
> the A register:

Command #11 (#$0b) expects N bytes it in buffer pointed by word

at IOCB+4 and N is word at IOCB+8. To put one byte you can get
PUTBYTE-1 procedure adress for S: device from handler table for
example. AFAIR that adress (don't remeber if -1) can be at IOCB+6 too.
But if not you can use jsr adress+1 from handler table or jsr to:

jumptoput: lda hi(adr) pha lda lo(adr) pha lda #bytetoput ldx #IOCBno rts.

> example.

Not recommended, because this bypasses CIO and thus all
error checking within CIO. It is also something device drivers
regularly have problems with. To write the data in the A register,
it is enough to set the length to zero - and load the data into
A.

So long,
     Thomas

Hi guys are there any sites that have good run downs on programing Atari
Basic? Its been nearly 20 years and I thought I would have another stab
at it.
I need to create a constant 10khz tone and remembered you could do it
quite easily under Atari basic. Sorta peaked my interest again;-)

Thanks

Mark

Mark,

AFAIK, there was a program that combined two sound registers to
produce 16 bit sound. Might have been in a Compute!, Antic, or Analog
magazine. I will have to do some looking for the code.

Rory

Well, for simple stuff, you just do, for example:

```
  SOUND 0,100,10,10
```

Where it's:

```
  0 = Voice (0 thru 3)
  100 = Pitch (0 (highest pitch) to 255 (lowest))
  10 = Distortion (in this case, a kind of 'pure' tone; other values cause
       different kinds of sounds... 0 and 8 sounded like explosions or
       the ocean to me... 12 sounded kind of like a horn)
  10 = Volume (0 (off) to 15 (loudest))
```

Doing two sounds very close together caused a neat interference(?) effect,
that sounded kind of like a Star Wars light saber, to me:

```
  SOUND 0,190,10,10
  SOUND 1,191,10,10
```

You can no doubt find a plethora of details in books which are now
available online, such as Compute!'s First Book of Atari, and the like:

```
  http://www.atariarchives.org/
```

Good luck!!!

You could use the SOUND statement to turn on and off a sound channel
with a specific pith.

Try for example:

SOUND 0, 140, 14, 15

The paramers are sound channel (0-3), pitch (0-255), distortion
(0-15) and volume (0-15). Change 140 a couple of times until you
are as close as you can get to 10 kHz. Maybe you have a reference
tone source to check with, to find the value that comes closest to
10 kHz.

If the 8 bit pitch resolution is not accurate enough, one can use the
16 bit mode. There is no BASIC support for that. In other words,
you have to use POKE statements to enable the 16 bit

mode. Below is a link to a page with a BASIC program that
does this.

http://www.atarimagazines.com/v4n5/soundpower.html

Good luck!

Anders

Xref: g2news1.google.com comp.sys.atari.8bit:2589

The frequency of a sound is determined by the simple formula:

Fout = HostClock / (AUDF+1) / 2

where HostClock is 1.7784 MHz for PAL, 1.79208 MHz for NTSC.
AUDF is an 8 bit number (2nd parm in SOUND statement) or a 16 bit
number if you join 2 voices together.
The problem with 8-bit sound is less range, plus the steps are
extremely noticable at high frequencies (ie low AUDF values).

I thought the base clock for BASIC Sound statement is 64 KHz and
Fout=Base Clock/(AUDF1-255)/2.

Your formula would give a range of frequencies from 3500.15 Hz to
89.6040 Khz (for NTSC).

I have always liked this sound mode. It is a bit arcade-ish.

This semi distorted waveform is probably used to create the engine
sound in Atari's Pole Position and the short music sequences heard when one
locks/unlocks doors in Synapse's Zeppelin.

Is it possible to combine two channels to 16 bit and play with the mode 12
type of sound?

Hi,

> This semi distorted waveform is probably used to create the engine
> sound in Atari's Pole Position and the short music sequences heard when one
> locks/unlocks doors in Synapse's Zeppelin.

It is also helpful to extended the available frequency range towards
lower frequencies and still have four channels available. This is
for example done by "Musica".

> Is it possible to combine two channels to 16 bit and play with the mode 12
> type of sound?

Yes, of course. In this case, the mode-12 polycounter is driven by the
output of the combined timer.

So long,
     Thomas

Make that 896.604 Khz. (Yes, I can use a calculator. Apparently I
can't count 3 decimal places though. LOL!)

I think the Atari drive was 38.4k *bits* per second, and I read that
the C= was normaly 3k *bytes* per second but did 4k in CP/M mode. I
don't know how much was overhead, but ther're close enough to each
other that it really doesn't make much difference.

But all tones produced with the 8 bit mode are a bit out of tune, aren't they?

[cough cough]

Forget everything I said, or almost everything.

The normal base clock (Fin) for BASIC Sound command is 63.9210 Khz (for
NTSC systems).

Fout=Fin/2*N where N is the 2nd parameter + 1 of the Sound command
which is also the AUDF1 value + 1.

You can't generate an exact 10 Khz sound with the Sound command. The
closest you can come is by using the value of 2 for the 2nd parameter.
This yields Fout=63.9210 Khz/(2*(2+1)) or 10.6535 Khz.

You can improve not the resolution but the granularity simply by
changing Fin.

To Change Fin to 1.78979 Mhz Poke a 64 into 53768 (AUDC1)

There is a revised formula for Fout with the Fin=1.78979 Mhz

The formula for the exact frequency becomes

Fout=Fin/2*(AUCF1 + M)

where
M=4 for an 8 bit counter (the norm for BASIC Sound command, AUDC1 bit 3 or 4 = 0)
M=7 for a 16 bit counter (AUDC1 bit 3 or 4 = 1)

You still can't generate an exact 10 Khz sound with the Sound command but by using

```
10 SOUND 0,85,10,10
20 POKE 53768,64:REM set Fin to 1.78979 Mhz
30 STOP : REM keeps the sound playing
```

However, if I did the numbers right this will generate a sound at 1.78979 Mhz/(2*(85+4) = 0.010055 Mhz or 10.055 Khz.

Hope I got it right this time!

Try the following program for fun.

```
10 SOUND,255,10,10
20 STOP
30 POKE 53768,64
40 STOP
```

Run the program. Listen to the sound. Type 'CONT' and press Return to change Fin to 1.78979 Mhz. Listen to the new sound. Type 'CONT' again to stop the sound

note: most of this information is from the Atari 400/800 Hardware Manual.

- Steve Sheppard

I have decided to reduce my inventory of classic computers, so
reluctantly the ST stuff must go. I have a medium-sized collection of
ST stuff including a Mega 4 STE, 1040ST, a couple of hard drives,
floppies, Diskcovery cart,software, disks, mags., etc. I estimate it
will fill a trunk of a full-sized car, and maybe some to the back seat,
but a pickup truck should not be necessary.

If you are interested, here are the "rules:"

1) PICKUP ONLY -- central Indiana -- southwest of Indianapolis.
2) AS-IS. It's been stored in my (heated) garage and family room for
about 10 years.
3) ALL or NONE. You take it all -- no pick and choose.
4) The actual pickup date will be at mutual convenience in later April
or May -- after the weather has settled a bit, and I have a chance to
separate the boxes of items.

If interested, "reply to author".

Thanks,
Larry

Hello,

Anyone heard anything more about this new board for the 8-bit?

This March I'm celebrating my Birthday! If you want to bless me, I'm
trying to raise Capital to buyout an Atari Dealer of all his Atari goods!
So give me your Atari business, send all Atarians Marching my way and help
save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled
from all items NEW in BOX from all my other catalogs made up of Hardware,
Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns

of text width it will be 80 column width, Most entries will be 1 line each
and sorted alphabetically by title. You'll only find my NEW items in this
catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org   Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm   Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm   Ben's Atari Birthday!
http://www.aracnet.com/~atari/wantlist.htm   What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your
order goes out the same day. Customers love the speedy service! I have
lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or
Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at
http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Hi

I'm looking for the binary image of the Speedy OS. I want to burn an
EPROM with this OS and use it of my 800 XL's OS. Anybody has a copy of
this binary file?

Regards

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Hi, I try to connect my old discman mp3 player to my atari 800xl
computer and its works :D. In 2 cds i can carry about 1000 games :)

See how I did:

http://erwin.ried.cl/?modo=visor&elemento=176

btw: is in spanish :(is my main language, but has many photos ;)

Thanks

I don't know the speed of the C64. The Atari is about 19.2Kbaud.
I believe the Commodore stock was/is much slower. I remember
loading commercial games from disk as taking 10 minutes or more,
about 300baud. I remember the C64 disk drive being about the
same as an Atari tape drive.

Some speed inhancements were available, using a different
port on the Commodore, but we're talking stock machines using
stock drives.

stock c64 with stock 1541 can load 40K in about 8 seconds without breaking a
sweat, enhanced using software only. Nobody uses the dud kernel routines :)

Beside, the subject is comparing to the 1571 and since that's a 128
centric device, you should compare it using burst mode, which is PDF
(pretty damn fast).

This is also true, but Im unaware of just how fast burst mode is. I have a
128 and 2 x 1571s, but I rarely if ever boot into 128 mode.

Point being, all the bad press commodore got for their drives was pretty
much unfounded once you dumped the admittedly atrocious kernel routines.

As I understand it, the Kernal routines for C64/1541, and 64 mode on the
C128, were written to maintain backwards compatibility with earlier CBM
computers and drives.

There may be some details on the website listed below. It has been a while
since I read this history through so I don't remember exactly how many
details...

Hey all. Wondering if anyone could tell me where I could get floppy
disks for Atari 1050 drive. Would prefer double sided, but can punch
single sided ones if needed. Also would prefer new if possible. If
anyone could provide me with information it would be greatly
appreciated. Thanks.

Hello all-

The nominal "winner" has been selected -- the first respose. Sorry, to
you others. There was definitely more interest than I had anticipated.
 If the winner changes his mind, I will contact the next responder.

-Larry

Ah. I didn't know much about the Commodore.
And I probably only ever used the 'kernet' (OS?)
routines. But still, if you have to load software
to make it faster, is that 'stock'? Atari has
to have DOS loaded, so that is the same, I guess.
The Atari boots the DOS, how does the Commodore get its' high-speed routine?
You load it first, or does it boot?

Most C64 commercial games use a fastloader that comes on the game disk.
Typically, the fast loader is part of a small boot file on the game disk.
You load and run the boot file which installs the fast load routines and then
loads the main game module, and any other files needed to start the game.

Stand-alone fast loaders are also available which, after they are loaded,
allow you to load your own BASIC programs, or other software that does not
have it's own fast loader, at greater speeds.

If its within a program (a game, or utility) typically the 'fastloader' is
installed at boot - a small boot file loads some code into the disk drive
and replaces the kernel routines, then goes on to load the rest of the
program. I guess its somewhat like booting a DOS.

For day to day use, youd probably be better off with a hardware based
approach (like an epyx fastload, action replay etc) just so you dont have
to keep reloading a fastload wedge :) It is hardware based, but its just a
plugin and requires no soldering :) However for someone who is simply an
end-user (plays games, writes letters) this is probably unnecessary as the
bulk of games/utilities come with their own software fastloaders.

And don't forget JiffyDos, which when equipped in both the drive and the
computer, provides 2-bit parallel communication over the IEC port, plus
removes a lot of the IEC chattiness of the stock routines, which makes
is one of the fastest solutions available; it's even faster than Burst
mode that Commodore supplied on the 128.

40K bytes in 8 seconds. 5K bytes per second = 40k bits/sec or
so. About 40K baud.
I remember a command that loaded most commercial C64/D128
disks. 'LOAD *' or something like that.
The Atari can go up to 56K bits/sec. using certain DOS and
a modified disk drive. I'm not sure the 'WARP' speed of
our peripheral emulator emulating disk drive from the serial
port of a PC, maybe 115,200 baud.
I don't like high speed features because they generate errors
on real disks, or failures with the disk emulators.
I prefer the 19,200 stock speed, our drives are getting old
and I'm more interested in reliable reads/writes than unreliable.
I use CRC check programs to make sure disk transfers are
correct. You might be surprised how many errors there are
in disk tasks. This is important with PCs as well. I just
found bad sectors on a 1.44 floppy using PCs. What bothers
me is that the read is encountering error sectors, but no report
of a disk error is occuring, just a program termination with
a failure. People don't expect read/write errors, and software
doesn't respond with a report of error. On the Atari, you
hear a 'chhhiiit' on an error sector, many people like to turn
the drive noise off, they are removing a source of info about
the health of a load. Sometimes it's a 'SNARK GRUNGE'
sound.
But I ramble.

This is a breakdown of results published by Click Here Software which
now produces and sells JiffyDOS.

Drive	C= 64		C= 128			
	Kernel (sec)	Rate (Kb/s)	Kernel (sec)	Rate (Kb/s)	JiffyDOS (sec)	Rate (Kb/s)
1541	95	3.22	95	3.22	9	33.95
1571	95	3.22	11	27.78	7	43.66
1581	78	3.92	10	30.56	7	43.66

>> example.

> Not recommended, because this bypasses CIO and thus all
> error checking within CIO.

Eh, not recommended ? By who and why ? If you had properly opened
IOCB f o r w r i t i n g without error then nothing can be wrong.
Now errors has to be reported in Y (Y>=$80) register by handler proc.
If you suffer from errorphobia :), then you may set Y to $92 as CIO
does (func. not implemented) before jump to handler.
Error checking by CIO (if everything gone well so far) is just

checking Y register after return from handler procedure.

> It is also something device drivers
> regularly have problems with.

This means one thing - device driver is f...ed up. Handler
PUT BYTE proc. cannot expect more info than it gets from CIO
and has to return status in Y.

>To write the data in the A register,
> it is enough to set the length to zero - and load the data into
> A.

That's should do it too, cause with command 11 CIO treats
length 0 as 1 and stores A as a first byte to go, but it does
more things (as, for example, rewriting 12 IOCB bytes (twice))
wasting time and not needed to put byte things (like plot).

You know about Fast Hackem for Commodore 64, provides a direct drive to
drive Ultra Fast copy without sending data to the computer memory. I am
wondering if the direct drive to drive copy is available for Atari?

That would make it faster then.

I didnt want to get into a pissing match (we'll leave that for the speccy
guys) but I just wanted to point out that the drive situation on the 64
isnt as bad as people make it out to be.

stephensheppard@hotmail.com:

>> I thought the base clock for BASIC Sound statement is 64 KHz and
>> Fout=Base Clock/(AUDF1-255)/2.

According to my sources it may be 15kHz 64kHz or 1.77 MHz.
Llast one I don't know if it's really PAL/NTSC relative as Stephen
wrote but it's possible (just clocking with main computer clock).
Mine docs says it's 1.77. Could check it if I had NTSC stuff ;P

So lets say it's (B)ase clock ;P and (D)ivider can be:

for 8bit register D=2*(AUDFx+4)
for 16bit it's D=2*(AUDFx+7)

Frequency (F) is F=B/D

> 1571   95   3.22   11   27.78   7   43.66
> 1581   78   3.92   10   30.56   7   43.66

I measured the time needed to read a full DD disk (720 sectors,
256 bytes per sector) on the Atari. Transfer rate is in kBytes
(1000 bytes) per second:

XF551 std speed: 128 sec -> 1.4kB/sec
XF551 hi speed: 80 sec -> 2.3kB/sec

1050 Speedy std: 114 sec -> 1.6kB/sec
1050 Speedy hi: 53 sec -> 3.5kB/sec
1050 Speedy hsscopy: 44 sec -> 4.2kB/sec

AtariSIO std: 100 sec -> 1.8kB/sec
AtariSIO xf551:   57 sec -> 3.2kB/sec
AtariSIO hi: 34 sec -> 5.4kB/sec

The Atari serial bus (SIO) does data transmission just like the
RS232 standard: 1 start bit, 8 data bits, 1 stop bit. Transmission
speed is derived from the main crystal and is slightly different
on PAL and NTSC computers:

Standard transfer rate is approx. 19 kbit/sec, XF551 high speed
is approx. 39 kbit/sec and 1050 speedy high speed is approx.
56 kbit/sec. 1050 speedy hsscopy uses someting like 80 or 90
kbit/sec. Note: hsscopy speed is only available when using the
speedy "highspeed sector copier".

AtariSIO is a floppy drive emulator that I wrote for Linux and
uses the standard RS232 transmission speeds of 19200 bit/sec
(standard mode), 38400 bit/sec (XF551 compatible mode) and
57600 bit/sec (highspeed mode)

The stock Atari 1050 disk drive can't do true double density,
the Speedy is a hardware extension built into the floppy drive
which is very popular here in Europe. It's similar to the
"Happy" upgrade. Both floppy speeders have some RAM on board
that is used as a track buffer (stock Atari disk drives don't
have a track buffer).

If you have a look at the net transfer rates, it is very obvious
that the raw transmission speed is not that important when comparing
drives. When using the standard speed, the results are quite close
to the maximum limit of ~1.9kbytes/sec. If you increase the speed,
disk drive latency (waiting for the next sector, stepping to the

next track) becomes more and more important.

Of course you can't compare the AtariSIO rates with the rates
of real floppy drives (since AtariSIO doesn't suffer from the
latency problems), instead use these values to get some impression
of the SIO protocol overhead (it's not too bad, only 8 bytes per
data frame plus some 2 milliseconds of minimum delays).

so long,

Hias

I guess that depends on the kind of games you play. Many commercial
games for the C64 that I remember came with a speed-loader. Though

speed-loader cartridges where also quite popular where I live. So I
agree with Simon that the C64 drive situation wasn't nearly as bad as
some people made it out to be.

No C64 setup was complete without an Epyx Fastload where I grew up. :)

It just wasn't usable without one.

I write a journal on my 130XE with AtariWriter 80. Recently I
purchased the MyIDE+Flash cart. Unfortunately, AtariWriter 80 (an
plus) switches back on the Atari OS and expects to load from SIO, so
it can't be loaded from the MyIDE cart. I'd like to find a word
processor that will load from MyIDE and has a printer driver for the
HP Laserjet Series II. Anyone have suggestions?

TIA

I recently tried to write a short routine for an autorun file to use with
MyDOS to format D9:, my damdisk. Well, I figured out a method to do it,
but... it doesn't work. :(

Before I can perform a DOS XIO on any disk, do I first have to open that
channel for write or what?

I would greatly appreciate a complete example of how to format a disk in
assembly.

Thanks!

There is a program called 'Fast fingers', a BASIC program
that writes and autorun.sys that will type anything you would
type at bootup time. It worked quite well with DOS 2/2.5/SmartDOS, so I
would thing MyDOS. It is essentially
a way to make a STARTUP.BAT for MyDOS, like you have
in Sparta/FteDOS. It is from an ANALOG I think. I have
a copy.
It shouldn't be all that hard to make an assembly program to
do what you want, tho.

I prefer to work in assembly whenever possible. And I have recently started playing around with I/O with it, but I'm just trying to find out how to format a disk. Should be fairly simple, but I'm skiddish to just jump in and play around... I could bork my hard drive pretty good if I make one small mistake. :)

Hi David-
Bill Wilkinson wrote a series on graphics and I/O in assembly language
in his Insight: Atari columns in November, 1981 through January, 1982.
Part of these is already posted at the Atari Magazines archive. The
others will soon be posted. There are certainly other sources, but
Bill's was an excellent start, IMO.
You can also search by author at the site.

It depends. When formatting a disk, you don't have to open the channel
first. When using note/point, you must use an open channel (of course).

> I would greatly appreciate a complete example of how to format a disk in
> assembly.

Using XIO is quite simple. Just set the command to the XIO number
(eg. 254 for "format disk") and set up the buffer address, AUXx
and (if needed) length.

Have a look at the MyDOS tech doc for an explanation of the
AUX1 and AUX2 bytes in the "format disk" function.

Here's some sample code that formats a disk:

```
        CIOV    = $E456

        ICCOM   = $342
        ICBAL   = $344
        ICBAH   = $345
        ICAX1   = $34A
        ICAX2   = $34B

        LDX #$10        ; channel #1
        LDA #254        ; format disk
        STA ICCOM,X
        LDA #<DRIVE     ; buffer = "Dx:"
        STA ICBAL,X
        LDA #>DRIVE
        STA ICBAH,X
        LDA #0          ; aux1, aux2 = 0, standard format
        STA ICAX1,X
        STA ICAX2,X
        JSR CIOV
        RTS

DRIVE   .BYTE "D4:",155
```

so long,

Hias

They also had some good old emulation software too, if i have my
webpages straight..

Thats a shame they are gone, a loss to many retro/emulation communities.

I remember hearing once that developers/publishers had multi-year
contracts with Commodore, and hence had to stick around even after the
8-bit market was no longer viable.

I have no idea where I heard it, and it doesn't really sound plausible,
so take it with a grain of salt. ;^)

I don't think publishers did exclusive contract like this back then like
they do now, so that's probably just a rumor. I believe the Atari
market was just much smaller than the C64 and Apple market and they had
to drop one of them.

The 64 was $100-150 less than the Atari when sold head-to-head in Sears,
and 64's were in K-Mart, so they basically took over. Atari had a
really nice product that was definately ahead of it's time in 1979,
although that came at a price. Not many people could afford to drop
$1500 on a 400/800, RAM, and an 810 drive. Commodore had nothing to
compete with that for 3 years, but came in at a very cheap price and got
a lot of kids right when the console market crashed in 83.

"IMO" :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

RELATED NEWSGROUPS:

     Probably a MIDI interface cable.

A short update... I recently bought the cartridge version of TBXL from Video 61. It works very well, containing both the Interpreter and Compiler with a boot-up menu to choose between them. AND, using the "Run at Address" function of MyDos at $2080, I've been able to get back to my TB programs *intact* from the DUP.SYS menu, so long as I have not copied or otherwise disturbed the program memory area. Cool! The only thing I've found that doesn't work properly is if you have chosen a subdirectory while in DUP.SYS, MyDos "forgets" the subdirectory and you are back to Dx:. But this is exactly like pressing RESET, where the Warm Start also causes MyDos forget the subdirectory.

I would have guessed at the, except for the failure to understand the term
gaffer tape, since it's used widely (the term, as well as the tape) in the
American film industry. After all, that's how it got the name gaffer tape
in the first place. At least, so I'm lead to believe.

Ken,
Do you know the checksum mumers : for the cartridge. I have a dump called
TEST ATARI 65-130XE R.2.ROM and probably not what you are looking for. A
couple of years ago I ran a program called RomCenter against my directory of
Roms and other files and changed all the names, but with the checksum # i

could scan my file to see if I have your request...

Hello All,

Just a quick reminder about the CD-ROM offer. Still a couple of days left!

This week (until 3 March 2006) I will be offering the DGS Atari 8-bit CD-ROM (commercial and PD combo) for the special price of $5 (2pounds for UK buyers), which is a $3.50 saving on the usual price. This price includes SURFACE MAIL shipping to any country (2nd class post for UK buyers). This offer is for those of you who want to save some money, but don't mind waiting as surface mail can take 60+ days!

If you don't already know, the CD contains most of the DGS commercial Atari 8-bit products and the full DGS PD library (191 double sided disks). The commercial products include the PPP products QUICK programming language, SAM 80-col GUI (no extra hardware required), and games, along with the Digi-Studio digitized music package, all 26 issues of the DGS newsletter, and more. All products are in both DCM and ATR format, and have PDF versions of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8-su.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

There's plenty of background info on DGS on the main part of the website.

Dean Garraghty

Hi

Anybody knows what happened to Jindroush's site? Is the Atari Cartridge
Dumping project still alive? This site had good info on A8 carts, I'm
sad it's no longer online...

http://www2.asw.cz/~kubecj/index.htm

Regards

PS: At least you can download the site's contents...

Wow, Jindrich sounds quite jaded!

That's too bad. I hate to see any A8 sites disappear.

Jindroush.Atari.Org will be missed!

The old Umich archive (no longer maintained, since they closed my account
since I wasn't a Umich student/staff/faculty >:^P) is probably still a
a pretty good starting point:

  http://www.umich.edu/~archive/atari/8bit/

Most of it was from a time before emulators and when SIO2PC was still new

and novel, so it's not just a ton of ATR disk images in ZIP format. It's
actually stuff you'd use directly on an Atari. :^)

XL Search is my search engine that lets you dig around the various
Atari 8-bit FTP sites:

  http://xlsearch.atari.org/

Good luck!

I already provided my best gaming links. The Umich.edu site also has
demos, programmers tools, every DOS imaginable, but has Bill Kendrick
mentioned, it's not up-to-date.

Can't remember if this is a mirror of the Umich site, vice versa, or
something completely different. In any case, huge collections here.

http://ftp.atari.art.pl/stuff/

For programming info you definitely want to visit Carsten Strottman's
page.

http://www.strotmann.de/twiki/bin/view/APG/

Need access to old Atari magazine articles? Try here.

http://www.atariarchives.org/

The SPACE newsletters are quite interesting.

http://space.atari.org/

There's many more sites. I just can't seem to remember them. (I
really have to organize my bookmarks).

Yeah, that was a good share.

Landon Dyer has some other funny stories to tell on his weblogs. Quite a
colorful story teller and has quite a lot of wisdom to share about working
in Sillycon Valley.

Working on a project where I need a total of 8 paddle inputs on either a
600xl or an 800xl with only 2 joystick ports. I really dont want to use my
800 for this so I need to stick with the xl's. I was wondering are the
pinouts inside buried somewhere? Does the XL ROM even support all 8? TIA
Mo

As I remember it there are only 2 paddle inputs per joystick port. To get 8
paddles you have to have 4 joystick ports.

Well, I think what momo was looking for was a way to get 2 more controller
ports on an XL. Not sure it's possible. I thought those bits were being
used for controlling RAM-under-OS-ROM, or something.

blush Yeah, >I< know what I'm talking about. 8^&

All,

I'm in the middle of changing the direction of my classic computer related
BBS, as a result I've been releasing my (rather extensive) file collection
as a group of bittorrents. Just recently finished my Commodore stuff & have

now put up my Atari 8 bit collections (2600, 5200, 7800 & 800XL).

The tracker is at http://landover.no-ip.com/tt

Help yourselves & spread 'em around.

regs,

Lance

Sure they are. The inputs are available on the Pokey chip.

> Does the XL ROM even support all 8?

No. Which means that you cannot use the shadow registers to obtain the
paddle values. You would need to read them from pokey yourself, which
is however only a minor inconvenience.

So long,

Thomas

So I'm _finally_ toying with CC65 (to cross-compile on Linux to Atari 8-bit), and am having a tough time figuring out how to do XIO calls (e.g., "DRAWTO" or "FILL" graphics, or disk-related stuff).

I'm new at this. (Plus it's late ;^)) Anyone got any examples?

Thx!

Well nothing beats the original. I am sure the others were different because
they wanted their versions to be distinguished from the original.

Exactly right, thats what I need is two more joystick inputs on either a
600xl (preferred) or an 800xl. Thanks again..
Mo

Hi Bill!

An XIO command is just a call to CIO. So you would fill an IOCB and do a
call to CIO just like in assembler (I don't think there are any cio
functions in the Atari library for cc65.)

You can do this a couple of ways:

1. Include an assembly .s file in your project and just call it from your C
program.

2. Use in-line assembly in your C code.

3. Write the function in C.

I'll try and post some example code a little later.

Disk related stuff is pretty easy to do via other built-in functions
(fread/fwrite for instance and dio.h for sector level read/write.)

Not easy, but possible.

It would have been nice if the XL line had used a 20-bit address space
with a new bank controller, allowing the ROM and RAM to be dynamically
mapped. Alas, they took the cheap route and used the existing Pokey chip
to handle controlling RAM and ROM, using the inputs used by the second
pair of controller jacks.

So at first glance, it's not possible.

But in truth, it's just not easy.

First, each controller has five digital inputs (four joystick directions
and a button) and two analog inputs (the paddles). The analog inputs
measure the resistance to get a value. So this leaves open a good
question: Did they actually hijack all of those inputs in Pokey in the XL
line? Perhaps the analog inputs still work, and you would just need to
solder in another pair of ports. Someone else here might know more about
this.

Second, you could add as many additional ports if you want to build a PBI
device with a controller chip. It could copy the port values during VBI
to be compatible with the 400/800 for the second two ports.

Easiest way to get them to read automatically would be to run something
like FixXL to put the older OS in place.

There was an article in ~ANALOG by Les Brilliant about using Coco or
Apple controllers with an Atari. He detailed the operation of the paddle
controller circuitry and gave values for caps and resistors. Not quite a
must read but not a bad idea either.

Cough, cough. Pokey's not the problem - its paddle inputs are still
open and ready for use. The bank switching logic is actually in PIA
which is responsible for the digital joystick input.

> So at first glance, it's not possible.

Sure it is. As long as we're talking about the paddes.

> So this leaves open a good
> question: Did they actually hijack all of those inputs in Pokey in the XL
> line?

As far as pokey is concerned, none of them. As far as PIA is concerned,
only bits 0,1 and 7 are used, but that makes both the lower and the
upper nibble unavailable for digital joystick input.

> Perhaps the analog inputs still work, and you would just need to
> solder in another pair of ports.

Yes.

So long,
     Thomas

So what do those three bits map to on the joystick ports on the 800?

Nitpicking: The analog input is not a problem, but the triggers on the
paddles are connected to the joystick inputs, IIRC the left/right pins.

So full support for 8 paddles (including their triggers) isn't doable
on the XL/XE.

so long,

Hias

I'm working my way up to selling one of my old XL systems on eBay. I thought I might enhance the offer by including copies of old 8-bit software, copies that I actually make with the system to demonstrate it works.

Games, of course, would probably be the most popular. I wouldn't include any copies of commercial software, of course, but I have several games that I originally laboriously typed in from the pages of Antic, Compute!, and Analog - a sort of personal "best-of" collection. Since many of those programs are now freely downloadable from atarimagazines.com, and thus easily available to anybody, would it be a problem if I were to include some of them in the mix?

They map to the up/down direction resp. to the right direction of
joystick 3 resp. 4.

So long,

That's not a problem with me, as long as you're selling the computer,
not the software. As a free bonus, including some software from
AtariMagazines.com sounds like a good idea.

Thanks all, interesting topic but the project Im working on is already very
involved without doing a hardware/OS research project along with it. I
thought it would be as simple as connecting two more ports to a few pins on
pokey and having at it. I think what i'll do is preserve my XL's and ebay
for a beatup 400. The keyboard on the 400 would be better for my use anyways
being as how most of the work will be outdoors. Thanks again for all the
info.

I'm here in Ohio. I'm not an Ohioan though, I'm a Chicagoan living in Ohio.
2 years now. Ohio's pretty cool. Need some good pizza here though.

Charlie

bill@newbreedsoftware.com (William Kendrick):
>Shawn Jefferson <sjeffersonTAKETHISOUTTOREPLY@shaw.ca> wrote:

>> 3. Write the function in C.
>
>I was hoping for #3, personally. ;^)

As promised:

```
#include <atari.h>
#include <conio.h>
#include <string.h>

char buf[256];
char dev[] = {"K:"};

#define iocb1 (*(struct __iocb *) 0x350)     // IOCB1

unsigned char main(void)
{
  iocb1.command = 0x03;
  iocb1.buffer  = &dev;
  iocb1.aux1    = 0x04;
  iocb1.aux2    = 0;
  asm("ldx #16");
  asm("JSR $E456");

  iocb1.command = 0x05;
  iocb1.buffer = &buf;
  iocb1.buflen  = 40;
  asm("ldx #16");
  asm("JSR $E456");

  cprintf("You entered: %s\n\r", buf);
  cgetc();
}
```

This code's pretty quick and dirty. Basically I am opening a channel to
the K: device and getting a line of data from the keyboard, and then

printing it out via conio. Probably there is a better way to use CIO from
C, but this is what I would do. I'd probably write a function I could call
from other parts of my program.

The #define at the top defines the label iocb1 to be the memory location of
IOCB1, and the __iocb struct is defined in atari.h.

Hope that helps.

PS: I've never had a need to call CIO directly, since most disk related
stuff can be done other ways, and for graphics, I think it's better to
write directly to graphics memory.

Bill Wilkinson said it but then went on to add the problem at OSS was
~more about choosing a platform to develop programming languages for
where fewer then 2% of the owners programmed. He also said it was
actually a Mac project that put OSS out of business vs. Atari.

I *think* the one most noted for the statement was probably someone like
Trip Hawkins at EA. The bean counters figured ~fixed cost for product
development and marketing with net return per unit sale => 'we must sell
xxx copies to turn a profit.'

FWIW we did the same calculations in the pharmaceutical industry. Didn't
matter if you could save lives or relieve suffering, just how big was
the market.

User error!   LOL

I had two copies of the patched 800XL dump. Wouldn't you know it, I
installed the wrong one on the real 800XL.

Sorry, for the mistake!

CLC & RTS work perfectly, at locations $FF73 (VFR, Verify First ROM)
and $FF92 (VSR, Verify Second ROM).

Now I can change the OS all I want and not worry about failed
Checksums!

So far, I've only changed the Color1 and Color2 default and set the
left margin to 0 (versus 2). Unfortunately, MyDOS' DUP.SYS changes it
back to 2!

OT: Does anyone know how to patch MyDOS?

Hello All,

This week (until 3 March 2006) I will be offering the DGS Atari 8-bit CD-ROM (commercial and PD combo) for the special price of $5 (2pounds for UK buyers), which is a $3.50 saving on the usual price. This price includes SURFACE MAIL shipping to any country (2nd class post for UK buyers). This offer is for those of you who want to save some money, but don't mind waiting as surface mail can take 60+ days!

If you don't already know, the CD contains most of the DGS commercial Atari 8-bit products and the full DGS PD library (191 double sided disks). The commercial products include the PPP products QUICK programming language, SAM 80-col GUI (no extra hardware required), and games, along with the Digi-Studio digitized music package, all 26 issues of the DGS newsletter, and more. All products are in both DCM and ATR format, and have PDF versions of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8-su.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

There's plenty of background info on DGS on the main part of the website.

Dean Garraghty

Me again eating crow.. again!

Although everything seemed fine, one of my changes above has corrupted
the Self Test! Don't know what else might be affected.

I'm going to shut up now and let some who knows what they are doing
speak about changing the OS.

- Steve Sheppard

Mmm.... I seem to remember a basic program that you could run and it
would ask you what colors you would like and give you the option to
turn off the disk sound. The program would then create a little
autorun.sys that would poke those values on boot up. It doesn't
change the OS, so you don't have it all the time, but back in the
day it worked just dandy for me.

I remember using it a lot to automatically set the left margin to
0, turn off the drive sound, and set a darker blue for the background.

I wish I could remember the name of the program...

You mean that sound is on purpose?! I thought the I/O just interfered
terribly with my A/V output. :)

Let me know if you find this program or a way to disable that ringing sound.

Actually, Doc... I have one laying around here somewhere, even though I
never had a C=. I think I snagged it up years ago in a big lot of shit I
bought for a song.

To kill the beeps, POKE 65,0. Poke any other number there to be annoyed once
more.

Simple as that. Or, if you like... even if you don't know jack about
assembly, you can use nearly any assembler to make a custom autorun.sys or
.AR0-9 file to do this for you.

An example would be something like...

```
10  *=65
20  .BYTE 0
```

And then just assemble it to a file. With the Atari Assembler cart, or
Mac/65, it'd be ASM,,#D:AUTORUN.SYS if you have the source code in memory,
or ASM#D:filename,,#D:AUTORUN.SYS if it's stored on disk.

You can repeat that string as many times as you like.

```
10  *=65
20  .BYTE 0
30  *=82
40  .BYTE 0
```

This routine will kill the I/O beep and set the left screen margin to 0

instead of 2 spaces.

I have a disk based assembler I could send to you in atr format, if you
like.

Hi all,

Does anyone repair these drives? I have one that needs some repair.
The drive powers up, but cannot be accessed. The drive keeps switching
between single and double density. Doesn't seem to find the first
sector. When setup as drive 2, and I try to do a disk directory, it
knows to go to track 20, so I think it may be a matter of alignment
and possibly a speed check. afaik,I dont think the drive is in
diagnostic mode.

Any help would be appreciated.

Thanks
Rory McMahon

I found the source of my confusion, and why a simple change had such
disasterous results.

My mistake was I used the monitor feature of Atari800Win Plus to do
make my ROM dump, after implementing the changes in the OS, also from
within the monitor.

I did my testing within the emulator by using the monitor RAM command
which allows one to make changes to the any part of the emulated Atari
on-the-fly. Making it possible to perform quick tests as the
Atari800Win Plus will hold the changes throuh a Cold Start.

I assumed that the monitor command, Write C000 FFFF, would give me a
good ROM dump. It didn't.

Everything went smoothly when I used a hex editor. The patched image
works fine.

- Steve Sheppard

For all your 8-bit needs, I would go to the Best Electronics website.

The planet size and position seems to be randomly generated. Press the
reset switch and you'll see it's different every time.

OK, I've gotten my SIO2PC and the trial version of APE. All has gone
well so far. Where do you guys suggest I find a good library of disk
images?

I'm somewhat interested in games, but more stuff like operating systems,
programming languages, terminals, etc. I also want to check out demos
for the Atari.

Aside from that, the landing pad colors are different and the actual version
doesn't say "PRESS TRIGGER TO CONTINUE" on that screen.

Well my 130XE took a dump over the weekend. I suspect the factory 'MT' ram
chips went south. I will be reworking the XE this evening and hope to have
the BBS up by tomorrow morning.

Thomas

Ok bad power supply... i'll dig out an extra and have it back up tomorrow.
(Possibly this evening)

Thomas

I'm reading the articles on using the PBI interface at
http://www.geocities.com/dr_seppel/pbi3_eng.htm
and it looks like it should be possible to build a PBI device that works
much like an SIO2PC device, only much faster.

I'm thinking that the ideal design would connect the PBI interface to a
USB port on a PC, and use minimal circuitry. I've never build a USB
device before, but I assume that there are relatively inexpensive
controller chips that would work. A little bit of additional logic and
probably some RAM would also be required.

Anyone want to work on this with me? (In person if you're in the Boston
area.)

http://www.crowcastle.net/preston/atari/

"Disk" version 4.0

It started as a simple sector editor, but I've added all sorts of features
to it along the way. Slower code was re-written in assembly. Features
were added.

The 4.0 release includes bug fixes and some new features.

I would very much appreciate any feedback.

And I'm hoping to add double density support at some point in the future,
once I obtain a drive that supports it.

erm..

the most worse I know, is Irving Gould and and not to forget: Mehdi Ali

Tramiel and Tramiel and.... etc.. have done a big contribution. Space
Shuttle, Mike Oldfield, just to name a few successors/user with Atari
Hardware.

Jack Tramiel left the 8bit market, and he also made some extra-money
with the XE, GS etc.. -series. But the ST/TT and Falcon series is
extra-class.

Kind Regards,

Daniel Mandic

Hi Payton!

Probably AMIGA nuts. Commodore Amiga did not care much about the C64,
IMHO.

The interesting thing about Amiga is that if it weren't for Jack, it
would have been an Atari product, which is where it would have been more
successful because the Amiga's architecture was more similar to the
Atari 8-bit line, where the ST's architecture was closer to the C64
line. Commodore had the chip resources (MOS Tech) to make the ST's
architecture even more interesting than it was and it also had the
people to parlay a smooth transition to the ST from the 64/128 line.

I think this story can be expanded in many directions. I like the way,
Miner and Haynie. The tribble A Chipset, and so. AGA, ECS as well.

It was many future-music at that time. The way of the Tramiels is
honourable, as well the way of [Gould's] Team, Haynie, Fischer,
Augenbraun, Nesbitt and many many other people.

Maybe the managers paid too much attention to the IBM-PC Market. But
they should release the AAA-Amiga. ermm.. as a penalty :)

Best Regards,

Daniel Mandic

I recently found out that there's only 32 levels on the Parker Bros version,
after which it resets back to 1. The First Star version's manual mentions
34 levels (the P.B. manual doesn't mention how many there are)

There's also 7 different animation sequences (every 4th level). The first
shows you returning to no reception, the 2nd a crowd is present, the 3rd
shows a car pulling up with you getting in it, the 4th has 6 solders
following the car, the 5th has 12 solders, the 6th adds 3 dogs, the 7th has
the car pull away just before you get in, and shows you chasing after the
procession, the 8th is a repeat of the 7th.

Hi Preston,

While I think a PBI device and USB are both a good idea I don't think
you will be able to get as huge a performance increase as you might
imagine in real world applications. It comes down to the Atari only
effectively being able to do ~.1 MIPs so you can only do ~24k load, inc,
store, branch, operations a second. Figure at ~57k BAUD the serial buss
is already doing ~7k.

I guess if you are willing to do DMA you could make it quite a bit
faster but that would be a much more involved design.

I've seen some of the USB on a chip designs, I think Rabbit is one of
them: Souped up 8049 type micro doing the work. It might be easier to
map it into the Atari hardware registers at $D000-$D7FFF. IIRC The page
wide decoding is already done and mostly open at $D600-$D7FFF.

Ok the BBS is back up. I have replaced the power supply and all is well.
While I had the computer at the house I reworked my soldering handywork from
15 years ago and it seems to run fine.

Telnet: thecafe.dtdns.net / use port 8888

Thomas

Usually, you can get in, but putting them back together may be
troublesome, since they don't all seem to have plugs over the screw holes.
Some appear to be glued together.

Mind you, gaffer tape works wonders.   :-)

Another difference between the original First Star version and the Parker Bros and the Max-A-Flex versions is the stars on the main screen are yellow in the original (same with the shield depots and energy generators); in the others they are all purple. A side note: On Earth, the stars are normally blue, except when the ship is taking off (purple) or landing (pink); they match the color outline of the ships rocket fire.

I suspected that was what it is. Over here, it's known as "Duct Tape". And,
yes, it has many uses. :)

Wonderful article on the history of Super Pac-Man on the 400/800 is up
at http://www.fyyff.com/, written bu the programmer (who also cranked
out Donkey Kong).

Anyone interested in the history of Atari games should take a gander.

Same stuff. I always though gaffer tape was black and duct tape was
silver and that was the only difference.

Assassin - the player with the highest score at the end of the month will
win a $25 cash prize!

ST Magazine - one lucky Atari caller will win a free 3 mag. subscription!

Also this month, just for the oh so "special" 8bit crowd, we are giving
away 1 copy of Dean Garraghtys' DGS 8bit CDROM to some lucky caller! :)

Good luck to all!

Yeah. Despite it's name, I learned a long time ago that Duct Tape SUCKS for
taping up ventilation ducts. In the case of Air Conditioning ducts, when
there is high humidity, condensation forms on the ducts and, after a while,
basically turns the adhesive to dust.

Another bit of useless information brought to you by...

Hi All. I received a couple of these cables in an auction win. Anyone have
any idea what they are for? Standard monitor port to female SIO.

Thanks,
Charlie

Hmm... You've got 1050 set as drive 1 and XF551 set as drive 2.
You boot a DOS disk from 1050. You put the boot disk or
some other formatted disk, that drive 1 can read, in D2: and it
won't get a directory. Right? MyDOS will see what other
drives there are, you say that DOS recognizes there is a D2:
What happens when you try to access D2:? Does the drive
whirr or get error 144. How are you attempting to access

D2:?

made was 1.03. Does anyone know the differences between 1.02 and 1.03
(changes/features/bug fixes)? <

There were a few obscure bugs present in BXL 1.01 and 1.02. These were
supposedly corrected in 1.03. AFAIK, there never was an orange cart
(or "two-chip") 1.03. Conversely, there were a few black cart 1.02's
released. If anyone knows of an orange 1.03, please reply. 1.02 is
very stable, and the toolkit works well. I actually prefer BXL to BXE,
mainly because of the Toolkit and Runtime package.

I tested the Single Density formatted disk on 1050. 1050 can read it. I
insert the same disk in XF551. XF551 still cant read it. XF551 is damaged. I
do not know what part is damaged. I think some chips are malfuctional or
5.25 mechanism. Which one is damaged?

Thanks!
Jack

I am wondering if the black box floppy board works with XEGS cartridge or
PBI of 130XE or SIO connection.

Thanks!
Jack

Hi, Jack.
I seem to be the only one responding and probably the least knowlegable.
Are you sure the XF is configured, with dip switches, to be D2:?
Are you sure your DOS will recognize D2:, ie. some DOS 2.0/2.5
can be configured to only recognize D1:. What DOS are you booting
with? Are you daisy chaining the XF to the 1050 as D2: or replacing the
1050 with XF as D1: for boot? Does the XF respond at all to your efforts,
whirring, LED coming on?

H'lo again.
There could be a problem with the electronics, in which case you
could try swapping chips, if you can find a source.
Does the XF sound like the disk is turning, or silent when the
busy light comes on, ie. possibly the drive belt. A common problem
with the XF is the SIO socket coming broke at the PCB, check with
a magnifyer the traces at the connector. OK, not either of those,
narrows it down some. When you open it up, does the head move
back and forth, and the disk spin? Could be the stepper motor
or spin motor. I don't know which mechanism the XF uses, but
you might be able to replace the entire drive mechanism.

Where's Rick Cortese when we need him?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

I command XF551 to format the disk. I hear the head moving fast during formatting. I think SIO in XF is ok. After formatting, it cant write as making boot sector and creating directory. The head moves back and forth as well ... motor is still running.

XF was the first happened to me. I forget to turn off the XF drive. It was left on in few hours. Heat sink inside XF felt little hot. It is not able to read. I turned off the drive for cooling down. The few hours later, the drive still cant read the disk. Any help?

Thanks!
Jack

ATTENTION Atari customers. I'm buying out an Atari dealer, cleaning out
his ST software. Then Atari 8 Bit & Jaguar! I've paid for 80% of ST Games/
software & received 60% of ST Games/software so far! About 400 NEW Games!
If this works out I'll buy out his 8 Bit and Jaguar stock! I need to make
shelf room for NEW inventory and raise the capital to buy more Atari. If
you would like to help save Good Ataris from extinction, buy ANY Games/
Software in my Classic Atari 8 Bit and/or Atari ST Catalogs and get
20% off! E-Mail or call Ben at (503)256-9974!

Thanks for the insights.

I got the orange 1.02, and noticed a few interesting differences with Basic XE right away.

The indenting of loops in BXL is very strange. In BXE, the contents of a loop, but not the FOR and NEXT lines are indented. In BXL, the FOR and NEXT keywords are indented to the same level as the contents, which to me looks very strange.

In general, I would stick with BXE for my 130XE, but I also have an 800 and wanted a version that could run on it.

-Jason

If I am not too late on this thread and anyone knows,

Is there any type of code built into the MIO to handle the 80 Column board
that
was planned to be released?

Or was any software/drivers/etc going to be disk based, or on the 80 Column
board
its self, if anyone knows.

Hi, Jack (never yell that near an airport... :-)

It is definitely not an SIO device.

The MIO and the Black Box both connect to an Atari via the PBI interface
on the XLs and the Enhanced Cartridge Port of the XEs; the Floppy Board
connects to the Black Box. I have not seen them attached to the XEGS.

-Jess

Hi,

I don't think this is a typical problem of the XF551, so I think you are
going to be on your own a little bit. I would resolder the SIO pins just
for good measure (be careful, the traces on the XF551 are very weak) since
that is such a common problem.

Other than that... well, I would probably personally try some guerilla
troubleshooting, but I'm not too keen to offer those suggestions to you.
There must be someone who knows more about electronics and the XF551 that
can help you.

"Jack Tseng" <tseng4@hotmail.com>:
>I command XF551 to format the disk. I hear the head moving fast during
>formatting. I think SIO in XF is ok. After formatting, it cant write as
>making boot sector and creating directory. The head moves back and forth as
>well ... motor is still running.

hi phantomm,
  no, not too late.

   the code to handle the 80 column was to be put into the same ROM
that holds the MIO driver code iirc. but that code was never released
as far as I know.

Ken

It takes DC voltage. But don't use the 9v that is used on the 1050 series
as it will blow the power supply. You can use a power supply from an Atari
5200.

Thomas

BXE is by far the best for the 130XE, the FAST command kicks ass, as well as
the command to use the extra 64K automatically, I forgot what it is. I did
my advanced level project in BXE back in the day, very modular.

That would be the "EXTEND" command, which moves the program code to the
upper 64K of memory, leaving all of the available conventional memory for
variables/data.

Gives you a combined total of ~96K of space available, much more than any
other Atari BASIC.

Eric has released version 2.0 of Dis6502 at

http://sourceforge.net/project/showfiles.php?group_id=145747

New features:

- DIS6502.exe can be run with a filename as a parameter. The type of file
  is guessed from its size and its header.
- Dis6502 now supports read and write labels for memory locations
- Dis6502 is now compatible with wine under Linux. You have to download
  the TrueType font file Atarcc__.ttf which contains a font called
  "Atari Classic Chunky". Copy this file in .wine/drive_c/windows/font.
  Download at http://www2.bitstream.net/~marksim/atarimac/acttfpc.zip

Fixed bugs:
- Merging contiguous segments could crash the application
- After disassembling, the disassembly window is synchronized with
  the bytes selected in the dump window.
- The small assembler does not accept illegal opcodes anymore to avoid
  generating $1A for NOP mnemonic
- Opcode $54 in Display List is now correct in disassembly listing.
- Dis6502.ini is now read from the installation directory, not from the
  current directory.

I have been cleaning again and I have an assortment of small computers
listed on ebay until Saturday afternoon. They are all in great shape
and work. I have replaced all the batteries in them (talk about

expensive) except where there are rechargable batteries. Hopefully
someone on this board might be interested in one of them, they can be
quite fun to experiment with.

For a list of whats there, to place bids or for more information and
pictures go to

http://search.ebay.com/_W0QQsassZtcbordp

You may want to change you listings to have the images open in a new
window instead of replacing your listing.

I wrote a program to read SpDOS directory from any DOS.
Somebody here gave me the idea.
You can download it at:
http://briefcase.yahoo.com/russgilb@sbcglobal.net
Just click on the Read+Sparta... .zip file and download it.
Let me know if you try it.
Oh, it can't do subdirectories.
It can't do DOS functions like copy, delete, run, etc.
Just a directory lister.

Hi all,

I picked up one of these and need to find out how to make a serial
cable. Anyone have a FAQ or webpage for connections? I would be
hooking it to port 1 of an 850 or Black Box serial port.

TIA,
Rory McMahon

On the lantronix side it is standard RS-232. I believe the blackbox also
has standard RS-232. But the 850 has a different pinout. Let me know which
one you will use and I can help you - I built one myself for mine.

Thomas

Thomas,

I would like to set up on the black box, but make cables for both.

Rory

Somebody had trouble downloading, somebody else got the

file OK.
After you go to the URL, you have to click on the 'My Documents'
folder, which opens to 'Read SpDOS dir from any DOS' .zip.
Just click it and download it. Thanks for interest. The
long 'Read...' filename will be OK in most browsers, methinks.
It unzips to T7.COM, the Atari executable.
This is the first time I've tried the Yahoo! briefcase to make
a file available to the internet.

I've got the atari800 emulator working with my MythTV system. Now all I
have left to set up is appropriate joysticks.

I've considered the Stelladaptor, but I have a lack of working joysticks,
and I never found ones that really lasted. It also seems weird that they
didn't get a single adaptor for a pair of controllers for multi-player
games.

I've seen some really interesting possibilities like the X-Arcade
controllers, but why do they insist on setting it up so that you use your
left hand for the joystick? Also, most of those controllers are set up to
mimic a keyboard with the Mame settings, which isn't very friendly for use
with a non-console emulator.

Thoughts? Experiences?

I want something that durable that I can turn our foster kids loose on.

I still have my original Wico ball-handle joystick from 20+ years ago and
it still works. Love those Wico joysticks.

(doesn't really answer your question however.)

Agreed. Get a Wico 3-way. The stick on these things is made from steel and
will last forever. Mine from 1982 is working fine.

in the 1983, Atari XL was released, Epyx and Activision released Summer
Games and Ghostbuster. In 1985 to 1990, Winter Games, Summer Games II,
Ghostbuster II, Championship Baseball and more were released for Apple II
and C64. Why did Epyx, Activision, other software companies stop making the
games for Atari? Poor Graphics, color or enough memory ???

I have the following Atari 8-bit stuff available, for free.
A bunch of it was stuff I didn't know I had, but was being kept in storage
by my father (along with countless floppies I have yet to go through :^)).

The condition: you have to arrange to pick it up from me in or near
Mountain View or Palo Alto. (I may also be able to meet up in Davis or
Sacramento on a weekend.)

Please contact me directly via e-mail if you'd like any or all of this.
First-come, first-served!

* Atari CX85 numeric keypad (probably works fine; haven't tested)

* Accuball trackball controller (probably works fine; I just cleaned the ball)

* Atari SX212 1200bps modem (has both Atari SIO and 25pin PC serial ports)
  (I can't find a power adapter for it!)

* Atari 1200XL mother board (looks like it was left outdoors :^(poor guy!
  Did not power up when I plugged it in. Either dead, or at the least needs
  some love and care. May be good for parts. Not upgraded; includes
  RF shield. Labelled: "DA 243 REV. A" on a sticker near the keyboard plug.)

  [Remember: This is just the mother board; no case, no keyboard.
  I have some power supplies that I think are appropriate for it.]

Thanks!

Of all the OS's written for the A8, which is the best XL/XE OS? (It
must recognize the parallel bus.) And which is the best 800-type
"compatability" OS used on the XL/XE for older software? And of course
-- WHY did you pick your favorites?

My favorite is the the Ultra Speed + OS from CSS. It is "the best"
because it works so well with the Black Box and Floppy Board. But even
without the BB, it handles UltraSpeed so transparently. It also
provides an extremely floppy-like ramdisk if you have expanded ram.
720 sectors, single or DD.

My favorite 800-type OS is Omnimon -- hands down, no contenders -- love
that monitor!!! I must admit, however, that especially using a VGA
up-converter, Omniview is very impressive. But it's still way behind
Omnimon, because there is so little 80-column software.

Has anyone had any experience doing this? I have a couple of XL/XE OS
that have pretty "ugly" viewability, and I'd like to alter the color
and luminance for better viewing. I haven't any success searching
through the OS code for the color register(s) or shadows.

I'm surprised there were no takers on this but I found a solution to
the no-boot condition, to many of my stability issues.

The SRAM chip that I used for testing is a 32K x 8. Since I was only
testing one ROM image at a time in all of my models I hadn't bothered
to hook up unused address pins. This left them "floating", a very bad
idea (did I say I was a newbie?).

Eventually I had moved on to testing a true external SRAM cartridge for
which I used a selector switch. This is how I discovered what I was
doing wrong.

I hooked the common pin of my selector switch to +5V (Vcc) and the

output pins to two address pins (A13 and A14) of my SRAM to give me
control of 4 banks, 8K each.

After loading the images I found that selections 0 thru 2 using my
switch were unstable but selection 3 was very stable. This is when I
realized that my switch was apply +5V to both address pins with
selection 3 but any other selection left one or two pins floating!

I've since rewired my switch (to GND) and I now use proper pullup
resistors for my address pins. The switch now pulls the address pins
LOW when asserted instead of applying +5V and no pins are ever just
"floating".

I still have problems.

- My simulated carts (hardware installed inside the 800XL) are more
stable than my external cart.

- My substitution for internal BASIC works well EXCEPT most Atari and
Activision images don't work. I think the ROM code is actually
attempting to disable the internal BASIC ROM which would actually
shutdown my SRAM instead. (I'm just guessing that's what's happening).

Most other ROM images work fine.

I think poor money ;) - how many Atari users who will buy
that games is still out there ? To make game is quite easy ;).
To sell it ...

Didn't at least one of those company's say that they wouldn't produce
anymore Atari 8-bit titles due to rampant piracy in the Atari community?

Hello,

I'm an avid 8-bit computer collector and have picked up a couple of
Atari 800's on eBay. The first is an original 800, but it did not come
with a BASIC cart. The second is an 800XL, but it did not come with a
power supply. I have also purchased a 1050 disk drive, but it did not
come with any DOS diskettes.

I have a couple of games that were on back sides of C64 software, and
they both boot and play fine on the standard 800.

Can anyone recommend a website for getting started in collecting and
using this stuff? Where can I get an RS-232 interface and term
software? Is there any PC software for writing Atari disks, or for
using the 1050 disk drive hooked up to the PC like x1541 cables allow
using Commodore disk drives on a PC?

Any and all information is greatly appreciated!

Thanks,

Payton Byrd

Larry,

Until someone with significant experience modifying OSes chimes in I
hope this helps.

The default color values for the standard 800XL appear to be at
$FB08-$FB0C. Color1 ($709) and Color2 ($710) get loaded from $FB09 and
$FB10, respectively. The defaults are $CA (202 dec) and $94 (148 dec),

respectively.

I did a quick test in Atari800win Plus 4.0. Changing the default values to $C4 and $9A within the ROM image does produce inversed video in BASIC and DOS. (BTW, the offsets in the ROM image for the above locations are $3B09-$3B0C)

The bad news is, for real hardware you would have to correct the OS checksums (which I do not know how to do correctly). This is not important in Atari800Win Plus because the emulator allows the Checksum to be ignored.

Third party OS ROMs might not use the same locations for the default color tables.

- Steve Sheppard

Ho, Payton.
I don't know what you'd want to attach a 1050 to a PC for.
There is such cable and software, called 10502PC or something.
I think it is used to make disk images of copy protected disks.
What's the x1541 used for? I can see maybe direct input to
a C= emulator?
There are a number of places to get the 800XL power supply.
You can do some writing of Atari software using a PC, but are
limited to double density, which a stock 1050 isn't.
You can get APE software for free that, I think the free one,
will allow you to use your serial port on a PC thru a APE
cable connected to the Atari.
There's a lot of Atari8 software on the internet. The APE
cable is a good way to pretty much bypass the 1050 and
just use your PC as a disk drive, with disk images up to 16 megs.
The comp.sys.atari.8bit FAQ is has a lot of answers to beginner's
questions, and the Vendor list is fairly exhaustive.
You can get a combination APE/PRO interface from Steve Tucker
at www.atarimax.com
Since the vendor list is so exhaustive I'll hazard some suggestions:
Video 61, B&C Computervisions, Best Atari, Ben Smith Atari
are still active. Someone here may have a spare XL/XE power
supply.
You can make an interface cable, if you're electronics handy and
have spare SIO and serial cables, I'm sure the directions for
the APE or SIO2PC cables are still available online, in the FAQ.
Good Luck

I can offer a little help.

There is no PC software, AFAIK, that can write Atari single density or enhanced density disks. Has something to do with issues with PC floppy controllers.

Hias Reichl has written a nice utility that can write Double Density floppies, but you would need an XF551 drive or one of the many third party drives system that can read/write double density, like SWP ATR8000, or Track, Rana, Indus, US doubler modified Atari drive.

Today, most people skip using Atari floppies and instead use an SIO2PC cable and one of the Atari drive emulation programs, including APE (Atari Peripheral Emulator, DOS and Windows versions), AtariSIO (Linux), Atari810 (I think that's the name for Windows NT/XP only), SIO2PC (DOS), and more. There are also programs for the MAC and possibly other platforms.

If you have an Atari 8-bit computer, a PC, an SIO2PC cable, and one of the disk emulation programs you write real diskettes, should you still feel the need.

As for connecting an Atari disk drive directly to a PC, you need a different special cable, one of two types, a 1050-2-PC cable or a Pro System cable. To be honest I do not know what software you need to go with this cable except that Atari++ (Atari 8bit emulator) can utilizes such a connection directly.

Seems like nearly all the software ever written for the A8 is available for download, mostly in disk image form, ATR. All the disk emulator programs recognize this format.

Sorry, can't offer much help regarding RS232 interfaces I have had the need for a modem for my Ataris for almost twenty years.

Best Electronics (www.best-electronics-ca.com) seems to be the premier vendor for obtaining genuine Atari hardware but you will need to purchase Best's catalog to get the most from them. They have a search engine but do not have an online catalog or ordering system.

My favorite links for downloading A8 software

Not being very patient or skillful with joystick, but wanting to see
into Jaeger's 'Pinhead', I search for a cheat.
Omnimon, load up Pinhead, press SELECT-RESET, search for
LDA #$05 ($A9 05) ... ah ha! there it is on page 6, $6D0 to be
exact, LDA #$05 STA $82 ($A9 $05 $85 $82).
So modify $6D1 from 05 to, say $20 gives 32 lives. I did a
$FF for 255 lives and played to 460,000, still have 30 lives left.
So, cheat, Modify $6D1 to any number up to 255.
You could also use Disk Wizard II and modify the file itself, if
you could get the offset right, search for bytes $A9 $05 $85 $82,
and once you find it, edit to $A9 $FF $85 $82. I'm pretty
sure the page zero is $82, could be memory wrong (mine not the
Atari.)

Hi JR-

That sounds neat. I'll be very interested to see how you come out with
the 272001! 16-in-1 would be very cool, indeed.

Ironic that Atari took the time to remove the Easter egg from the 1200XL version of the keyboard test, but didn't bother to re-map the keys. It's like, they'd rather see a programmer not be credited for his work rather than put out a bug-free program....

Well, I burned 16 OS's to a 272001 and guess what.....It worked like a
charm. I can now have 16 OS's of my choice available at all times.
Also since I don't have to solder any of the wires to the EPROM, I can
have as many OS's as I'd ever need just by swapping the EPROM with another.

So, now I want to know.....what are everyones favorite alternate Atari
OS's and what special features do they have?

Can anyone recommend an 80-column terminal app with VT100 emulation (and
where to get it) for the 8-bit that works with the TCP/IP modem emulator in
APE? I'd like to use my 130XE as a VT100 terminal for Linux, so something
fast would be good. I tried IceT, but it didn't seem to recognize APE as an
850 (though this could be due to me not setting something up correctly).

Thanks.

Jason Harmon

Yeah, I put those photos up. (That's actually the manual, not the box.)

Someone gave me a "STAR RAIDER" cart a while back. When I went to take
a photo for the Wikipedia entry, I couldn't find my "STAR RAIDERS" one.

It was simply a misprint, and they didn't catch it until after making a
batch, apparently... :^)

    You could try Flickr Term 80. I believe with both programs you need to
  pre-load the R: bootstrap program before starting the terminal software.

    This is probably called AUTO850.COM or something similar.

Wait, what was the easter egg? It sounds familiar, but I don't recall
ever seeing it. :)

And yeah... the non-reorganizing of the keys on later XLs seemed pretty
retarded. :)

On 1200XLs, if you select 'all tests', when it gets to the keyboard test
it'll type out the programmer's name.

All older stuff because I am not familiar with the newer ones with fast disk drive support.

My favorite when I was programming was Omnimon. Built in ability to interrupt any program and a combination [monitor, disasm, Primitive DISK I/O, asm] with a lot of features. Good compatibility too.

For compatibility Omniview was better then Omnimon. There were still some problems with programs that looked for a modified OS. Built in 80 column support, good compatibility, and IIRC it worked best with the Newell memory upgrades<built in ramdisk handlers> and with my ATR.

Modified XL. Just added PD hacks like fast FP routines, fast screen handler, left margin zero, default color darker so it was easier on the eyes.

Thanks for the info, I will Google some more.

Yes it seems most want to View or Play Atari 8 files on a PC.

I'm doing a small project on an Atari 8-bit and was wondering if any
progress
has been made in these areas.

Thanks..cool. Actually I just found a cartridge list that notes the
variation. I did look prior to posting but couldn't find anything on it.

Guess nobody has any idea. I got an idea and it was correct.
Now I have a custom chip that doesn't detect collisions. Might try it
on PacMan or something.

I am auctioning off an SWP ATR8000 CP/M Interface on eBay. The manuals and some software are included. You can do a search on item# 8760847404 to find it.

I know it is a long shot but I am looking for Atari 1450XLD case parts. I have an XLD case bottom and an 1450XL motherboard, I would love to find the rest of the bits.

Nick

It looks like it was the same until Rev.C of the XE OS. Which computers
that was in, I don't know.

Hi Ken-
This came up not too long ago, but I can't find my post -- maybe the
thread didn't get archived.
Anyway, (abbreviated) I talked with Tom Harker of ICD (mid-late 80's?)
and he told me that the all the engineering was completed. Tom said it
would not be released because there just was no economic justification.
 AFAIK, none ever made it out to the public. -Larry

Well, actually I meant that all instructions are executed in hardware.
You're quite right about all the rest :).

Sorry, but the Pentium 4 is not i686. The Pentium 4 is ia32. The i686 is a RISC processor family of Intel. I believe it was meant specially for media purposes (audio, video), but I'm not sure.

I believe you might be mixing up i686 with i860.

Um...
I think you're slightly confused...
i686 is the general architecture, ia32 is just an even more general name for
it.
Pentium4(all 32bit variants), athlon(all 32bit variants) count as i686.
All pentiums (I,MMX,II,III,IV), 486s and 386, athlon, cyrix etc count as ia32

There has never been an "official" i686. They may have used the name
internally but since the 486 they haven't used the xxx86 name (has to do
with IP rights)
The cpu you are referring to is though an i960 (not an 860).. BTW: All
intel cpus from 486 onwards are RISC at least at their core. An extra
compatibility layer CISC interpreting Microcode is what makes them x86
compatible (I am oversimplyfing here of course)

The IBM 720K 3.5inch mechanism can be upgraded for XF551. Is it ok if IBM 1.2MB 5.25 is upgraded ? need modifying XF rom? Because 1.2MB can read 90K, 180K, and 360K disk as backward compatible. Use 160 * 30 * 256 bytes.

Yes it is so, they have had, at Intel, what they thought would be 686
and 586 developed in parallel.

I was in a presentation form the local representative of Intel and they
were describing their 586 and 686 projects.

What came out was Pentium and Pentium Pro, and they were much as they
had described. I think the floating point capability was the biggest
surprise (not thinking of the bug).

I think 80686 was a number they had already used for something entirely
different or maybe it was another company that had used it, which was at
least part of why they dropped the number.

Knut

Hi Jack-
Here are some obstacles that you would need to overcome (many!).
1) In order to provide 80 tracks, the 1.2 drive must be set to "single
step" as if it were in HD mode. This drive must "double step" to
provide 40 tracks.
2) It spins at 360 rpm vs. 300 rpm on a 360K drive.
3) The physical tracks written by the 1.2 are only about 60% as wide as
a regular 360K drive to accomodate the 80-track feature. If you write
a disk with the 1.2 and try to read it on a 180K or 360K drive, you
probably would not be able to.
4) Unless you could figure out how to double the data rate on the XF
board, you cannot put the 1.2 in HD mode. You are limited to regular
DD MFM data rate of 250 KB/sec. -- 360K.

5) I'm reasonably sure that you can use a 1.2 mechanism as a
non-standard 360K drive, but it is not recommended due to compatibility
reasons. I've never done this, but I remember seeing a 5-1/4 + 3-1/2
"combo drive" on ebay a few years ago. The drive was used as 360K +
720K. And IIRC, someone was using 1.2's as 360K drives with an ATR
8000.
6) If you want to do a 1.2, then that's that, but a 720K/1.44 drive
casts $10-15 new...

Hi!

The most significant difference with the Pentium PRO is, that it have
speed-problems with "not" 32bit OS (Win9x/ME, DOS etc.). So a 200MHz
i586 is faster than the 200Mhz i686, in DOS for example, but never in
NT and so, not to mention the faster (full speed [200MHz at that time],
CPU integrated) 2nd Level cache.
They corrected that speed-behaviour with the P2 and P3 (bez MS wanted
to sell 9x/ME, I would say...), the so called P6-Core CPU´s. And the
Tualatin (though Pentium III) is again an i686, whatever this means
:-). I think it is the partly RISC build, why they call it i686.

The Pentium CORE have not been changed since the 'Microopcode P4',
which are made for Video and Audio purposes.... they have no thrust
:-)))
except the EE, but I would rather use its power for shopping and so :-)
0.22HP :-)

I did not know that the P4 is also having RISC parts.

Best Regards,

Daniel Mandic

AIUI, it's because numbers can't be registered as trademarks in some
countries.

Good luck.. they are no where near the same value.. considering you can
get a C64 for free pretty easy these days if you look around. Remember
the 64 is the largest selling computer (excluding the 'pc'), so much
so its hard not to trip over the damned things..

(not trying to start a 'which is better' flamewar here, just talking
current hard value.)

I just picked a 1200xl off ebay for $22.95.

and and 1050
and a printer
and some carts
and a 850
and a 410

woohoo..

Charlie

shipping is 40 bucks but I think its about right, if any of it works.

Ziggy,

  I have one I swapped out in 1991 because of limited functioning with a
  shift key and and the "d" key. They would function if pressed hard enough
  (bad for a touch-typist like me). I'd let you have it for a small
  fee+shipping.

Demivec
for working email (take out the garbage if present)

I recently picked up an OSS Basic XL cartridge off eBay. It is an orange
one, which says version 1.02 when it boots up. I believe the latest version
made was 1.03. Does anyone know the differences between 1.02 and 1.03
(changes/features/bug fixes)?

Thanks.

-Jason Harmon

The burned out SN74LS38N chips was replaced with new one however Atari XF551
drive still cannot read/write the Atari 90K/128K/180K formatted disk when I
turned the system on, keep saying "Boot Error". But formatting is ok. Which
chip is used for reading/writing ability?

Thanks!
Jack

If you are getting 'boot error' it is when you are powering up with
a non-DOS or no floppy in the drive, or maybe even the drive isn't
configured as D1:   If your formatting is working then you are using
a DOS disk and booting satisfactorily, unless you have a cart DOS
like SpartaX or MyDOS on cart.

1050 sets Drive 1. XF551 sets Drive 2. 1050 boots any DOS - ok... DOS
recongizes the XF551 as drive 2. I tested XF551 to read the formatted disk
as DOS 2.x. But it still cannot read. any help?

Thanks
Jack

How can I tell if my 1050 has been extended for DD? I found an SIO2PC
on ebay and went ahead and bought it. Is that really all I need to load
software directly from my PCs?

What about RS232 interfaces?

Your SIO2PC cable may/probably can be used with your PC and
APE software as a modem cable. I haven't had much luck with
it for that tho. The serial interfaces for direct use with the Atari
are the PRC: connection, the old 850, or possibly, but expensive
Black Box or MIO. People here are talking about a Lantronix
or something to connect their 8-bit with a PC, for internet access.
About the only thing I can think you'd do 8-bit on internet is
a *nix shell account. There aren't many (any?) dial up BBSes.
Most ISP require at least a 9600 baud connection, which is
pushing it for an 8-bit, you'd have to train your modem to
9600. Some people claim 19,200, but I haven't had success with that.
The Atari at 4800 baud is about the limit in my experience.
Ice-T and Bob Term are probably your best term software for
A8s, probably Ice-T.

Oh, how to tell if your 1050 is modified for double density.
Stick a double density disk in it, if it SNARKs and BARFs, it
isn't double density. Probably you have a stock 1050, just a guess.
(When you try to boot or read a DIR).
You're going to need a DOS disk, or two. The SIO2PC cable
and SIO2PC or APE software will allow you to write DOS disks
in your 1050. The main A8 DOSes are Atari DOS 2/2.5, MyDOS 4.53,
and Sparta/FTe DOS 3.2g. SpartaDOS X is a cartridge that will
allow you to format and make bootable a real disk in a 1050 without
anything but the cart.

FamilyNet International Newsgate

I would say stop by www.atarimax.com and get a SIO2PC cable. That is what I suggest to anyone just starting out. With that you will have access to literally thousands of disk images. And with that setup you can access the internet with your 8-bit Atari to the internet through the Pc.

Good stuff. And then you can naturally add more from there at a leasurely rate. But yeh, SIO2PC cable and the APE software he offers there.

Well, I'm running a telnet BBS on my Commodore 128 at the telnet address
below. I had a friend many years ago that ran a BBS on his 135xl (??)
that was pretty cool, and with the disk emulator software I may be able
to justify putting up an Atari BBS as well if I can find some software I
like. I would also just like to be able to say that I can put my
Commodores, Apples and Ataris online at the same time and all of them
call my BBS!

Good question. Sounds like you are limited on diskettes at this time.

If you don't actually have a DD density diskette yet nor a DOS diskette
it would be difficult.

- You could open the the 1050 and look for the US doubler ugrade.

- If you still have a PC with a 5.25" drive kicking around you can
download Hias' WriteATR and copy a DD ATR (disk image) to a real
diskette. You could then test it in the 1050. Probably not worth the
effort.

- Wait until you get you SIO2PC cable and then attempt to format a DD
diskette on the 1050

 >
> What about RS232 interfaces?

Can't think of any low-cost units except R-Verter . You can even make
one from an SIO2PC cable with a few parts.

I've got a link (if I can find it... Sorry, it will have to be
tomorrow).

Are there any BBSes to dial into, though? 1995, or thereabouts, was
the last time I connected to any BBS and that was with a PC.

Yup, just point your Hyperterminal at paytonbyrd.dyndns.org:6400, or
even better, get CG Term at <http://www.paradroid.net/cgterm/> and use

it to call paytonbyrd.dyndns.org:6400.

Hi Steve-

> Until someone with significant experience modifying OSes chimes in I
hope this helps.

The default color values for the standard 800XL appear to be at
$FB08-$FB0C. Color1 ($709) and Color2 ($710) get loaded from $FB09 and
$FB10, respectively. The defaults are $CA (202 dec) and $94 (148 dec),

respectively. < (snip...)

Thanks much, Steve -- I'll start snooping around these values.   Yes,
those checksums could be tricky.

Hello Payton-
Congrats on your purchases! I skimmed through the posts here, but did
not see one suggesting that you download and read the FAQ's. We are
very fortunate to have some very nice FAQ's.

http://www.faqs.org/faqs/atari-8-bit/welcome/
This is a concise index of some interesting aspects of Atari 8-bits.

http://www.faqs.org/faqs/atari-8-bit/faq/
This is the link to the main FAQ's. There is a lot there, but well
organized and easy to find topics of specific interest. In particular,
check out section 10.

Good luck,
-Larry

I need to find my little black book from way back when I modified a lot
of atari game for unlimited etc.

For pinhead though I'd rather see a cheat where if you miss the balloon
just falls through the playfield and you keep playing..... or at least
get rid of the loud death dirge.

-Didn't at least one of those company's say that they wouldn't produce
-anymore Atari 8-bit titles due to rampant piracy in the Atari
community?

Definately a problem then, but in a way it was worse for C-64 and A2
people since software alone would copy the disks. Maybe it was because
you had to buy hardware copiers for the atari that so many more titles
were cracked to no protection and distributed via BBS vs. copy parties
or mail trades.....

It wouldn't be too hard to fix for unlimited lives. The number of lives
is kept at B2. So, you could search for a DEC $B2 and change to
NOP NOP, maybe. Anyway 255 lives gives you over an hour of
play, plenty long enough to get a score of 500,000 and be able
to see what 'Pinhead' has. After about 125,000 it just repeats, with
no new stuff happening.
I thought some people might want to modify it themselves.

I bought an SIO2PC interface for mine from Steven Tucker and he is a
great guy. I didn't have the disk drive cable so he sent me a different
cable that didn't need it.

You can pretty much do anything you want without the disk drive itself-
it's not needed unless you are trying to copy real disks.

Same thing as Commodore 64. They made more more games for C64 even though
there are many piracy in the Commodore community too. I am confused!

Larry:

> Yes,
> those checksums could be tricky.

If you changing anything in ROM just calculate new chksums
and change it too - cause not only emulators can check it
so more safe is to have them correct. Procedures for checking
ROM does it - vector E4something ;) - I don't remember now,
but it's not necessery to look - its just plain sums of all cells
in particular ROM regions (no CRC or this kind of stuff) :).
One thing to check is what cells are not in sums.
As I can remember it's probably C000-C001 and FFF8-FFF9,

but make sure that's true yourself :).

I hated going to weddings.
All the grandmas would poke me saying "You're next".
They stopped that when I started doing it to them at funerals.

I think EA was another that gave the piracy reason for not supporting Atari.
I do know that there were a LOT more pirate copy programs/hardware mods for
C-64 users back then, but Atari piracy seemed to get more of the headlines -
esp with cases like Lucasfilm's games being pirated/distributed directly
from Atari :/

The more I think about it, the more I am convinced Atari is cursed. For
the sake of brevity, I'll just refer anyone interested to my recent
commentary on 1up:

http://my.1up.com/do/blogEntry?bId=6574516&publicUserId=5678011

But really, the only way I can explain Atari's MANY blunders and
foolish moves, under the leadership of so many different owners/CEOs,
is a curse. Nothing else makes sense anymore.

It was probably because the C64 as a computer sold much better than the A8
(later on anyway), thus Epyx and such were still able to make their share
with what they sold for the C64, though the Commodore versions were copied
as heavily.

And I think the Atari versions weren't just selling that well.

Sad, but true.

Frank

Probably the reason why they stopped making software for the Atari is
the same reason a lot of companies stopped making software for the
Nintendo 64 when the Play Station came out. On the C64 for the
majority, if you wanted to play any game software you needed a disk
drive, for the Atari you could play lots of games that were cartridge
based and never need a disk drive. So if they made games for the Atari
they would need to either make them cartridge based, or disk based. If
they were disk based people how had no need for the drive woul have to
buy them to play it. It is cheaper for a company to make disk based
games than cartridge based games. The same happened with the N64 and
the PS, cheaper to make CD's for the PS than cartridges for the N64.

I don't know...same thing could be said about the Amiga under Commordore.

I also believe, IMHO, that the Atari 16 bit line was significant at the
time.

You didn't have an option with the N64- you had to use carts. Not so with the Atari computers. There were only about 200 carts made for them(including the later XEGS releases), compared to the few thousand titles made on disk. Not many companies were making cart-based software by the early 80s b/c it was much cheaper/faster to produce disk-based software. Companies only abandon platforms if there's no money to be made. They abandoned the Atari 8-bits b/c people weren't buying enough copies of games, and the reason most gave was that it was due to piracy.

That's certainly true for the US market and/or the early 80s.

Europe, and Germany where I come from, had always been more
cassette-oriented. I don't remember seeing that many cartridges in the
shops. Even disk-based games were not too common, and mostly only available
from mailorder services specialised in Atari software. Most shops, even the
big stores, were stocking cassettes, if any A8 games, at least from '85
onwards.

I guess the same holds true for the UK and, later on, the eastern European
countries.

As for the hardware's capabilities, that's clearly not the reason why so

many Atarians missed out games like Summer Games II et al. Just have a look
at the huge amount of software ported to the Spectrum, a good, but
technically inferior machine.

No, I still think it comes down to Atari having not been able to find enough
takes for their A8 line. The C64 (and the Speccy, that is) sold many more
units, thus justifying even the oddest port. There were just too few Atari
out to make ends meet.

Back when I was fooling with OS code I found it easiest to just disable
the checksum. I can't remember how/where I did it, just a couple of NOPs
or something in the checksum code. I'm pretty sure at least one of the
Wooley hacks includes a where and how to that he used for his modified OS.

I didn't have any trouble with 9600 using an 850 with my 130XE and
Bobterm back in the day. I haven't used it online, though, since Delphi
dropped dialup service. My current ISP has a 14,400 bps minimum.

Well, isn't that interesting...Despite what it says on my ISP's website,
I just managed to connect with my Linux PC at 2400 bps, and I'm here now
downloading and uploading posts. Working fine, although it sure seems
slow compared to the 56K speed I'm used to. I'll have to rethink the
possibilities of going online with my 8-bit again...

I must say I'm very impressed with the attention to detail put forward
in the Atari 8-bit FAQs compared to the FAQs for Commodore 8-bit
machines. Even though there's a TON of information in the Commodore
8-bit FAQs, the FAQs just doesn't feel very approachable.

IMO, the failure of both companies is directly tied to Irving Gould and
Jack Tramiel. Why Irving Gould and Atari? Because the act of firing
Jack Tramiel killed both companies because Jack at Atari was too
possessed with outdoing Commodore instead of focusing on product, but
Jack was Commodore's rudder and was the perfect fit for managing their
engineers. I don't think Jack fit the culture of Atari and Commodore
was just adrift without him.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Thats a very interesting point as well. I mean for sure, that was a
defining moment for both companies!

Anyone know what happened to www.emulators.com/xformer.htm ???

This site had good info on using a Xformer Cable on a PC if I remember
correctly.

I was doing research on something similar awhile back. Not sure if I saved
the Web info
 from this site or not.

Reason I ask about it: This site showed you how to alter the normal Xformer
Cable to work
on a PC. It was easy to do, only a wire or two needed changed.
Anyone happen to know how to do it or have a text file on modifying it?

Hopefully, it will come back up later.

Hi guys

Just to let you know we've posted our first effort on porting the
excelent New Rally X game by Namco to the Atari 8bit. This demo is in a
very early developement stage, but it's a start.

Here are some links to the screenshots and the Atari executable you can
play on your favorite emulator, or even on your real Atari!

http://img.photobucket.com/albums/v688/monitorero/nrx02.png

http://img.photobucket.com/albums/v688/monitorero/nrx01.png

http://www.atariware.cl/foro/download.php?id=158

If you read spanish, you can read the feedback here:

http://www.atariware.cl/foro/viewtopic.php?p=4534

...and if you read english, you can read the feedback there:

http://www.atariage.com/forums/index.php?showtopic=83947

Enjoy!

"Jack Tseng" <tseng4@hotmail.com>:
>Same thing as Commodore 64. They made more more games for C64 even though
>there are many piracy in the Commodore community too. I am confused!

With a smaller market, piracy takes a larger bite out of your potential
profit. The C64 market was huge in the later days...

Does anyone have the scoop on this? I recall reading somewhere that the
head guy at one of these company's went on record as to why they weren't
selling Atari 8-bit software anymore.

>Thanks much, Steve -- I'll start snooping around these values.   Yes,
>those checksums could be tricky.

You can just kill the code that does the checksum check.

Here's an example from some of Bob Wooley's SmartIDE code:

```
0250  *=$C31D  KILL ROM CHKSUM
0260  NOP
0270  NOP
```

I tried just CLC, RTS at $FF73 and $FF92, the checksum verify routines,
but that didn't completely work.

Kind of strange, for Atari800Win Plus it worked but in my 800XL it only
partially worked. By that I mean, if I install a game cartridge all is
fine but if I try to boot with no cartridge or with a programming
cartridge (BASIC, ASM ED, etc) the 800XL just boots to a blank desktop
with the block cursor in the upper left-hand corner. No disk I/O and
no sounds.

I'd like to try NOPs but I don't understand why a simple CLC and RTS
didn't work so I'm also not sure what instructions are safe to replace
with NOPs.

Atari lovers should disdain Irving Gould as much as us Commodore nuts.

I don't seem to have access to the Commodore newsgroup. And I am first and

foremost an Atari user. However I have this C128 sitting here and was
wanting to experiement with it as I never had one in the 'day'. Does anyone
have a 1571 disk drive they would be willing to sell? TIA

Thomas

There's tons of them on eBay. You should be able to snag one under $35.
    If you can settle for a 1541 those can be had for under $10. A 1581
will typically run about $75+.

I have extra 1541's if you need one. I'll take $10 + packing +

shipping. I am out of spare 1571 and 1581 drives currently. I also
have a ton of software if you're interested.

What do you mean by this? Does your news server not carry comp.sys.cbm?
  How about alt.c64?

ATTENTION Atari customers. I'm buying out an Atari dealer, cleaning out
his ST software. Then Atari 8 Bit & Jaguar! I've paid for 80% of ST Games/
software & received 60% of ST Games/software so far! About 400 NEW Games!
If this works out I'll buy out his 8 Bit and Jaguar stock! I need to make
shelf room for NEW inventory and raise the capital to buy more Atari. If
you would like to help save Good Ataris from extinction, buy ANY Games/
Software in my Classic Atari 8 Bit and/or Atari ST Catalogs and get
20% off! E-Mail or call Ben at (503)256-9974!

Memory is to foggy now but I seem to recall the checksum code I hacked
did just a bit more then the checksum. That is it does the checksum and
initializes some other values.

Anyway, Shawn just posted the spot for the XL OS to NOP. I do recall the
code is identical in the 800/400 OS, just in a different location, so
you can just search for the byte sequence to find it.

OK, now I'm scared. I'm a huge fan of Linux and FLOSS in general, but not
even the most reclusive part of me would claim that these are friends of
mine who have had the priviledge of penetrating my inner circle...

Hi!

What is Messyrs. gdb and gas?

Best Regards,

Daniel Mandic

Just as a point of note: When purchasing my 400, there was the option for a
touch keyboard instead instead of the membrane, which I chose. It cost more,
and there was also a memory upgrade for about enough to place my 400 $175
cheaper than the 800. I figured I could live without two cartridge slots.
They were all possibly aftermarket items, but you could never tell by the
look and performance. But these were the days when a "computer store" pretty
much only dealt with one line, and was a hole in the wall.

> Overseas the Atari Computers were very much overpriced with an importers

Possibly. I like to think of this situation as the same thing that MSoft is
doing with the Xbox360 pricing scheme. I hope they have learned the lessons
past, or at least think the market has moved beyond the 80's. It is their
game to play, I guess. Now all computers are readily available, in most
stores. (except Apple, but that is a boutique). Why give a dumbed down
version of your flagship product? This can only serve to antagonize

customers.

> They should have realised what they had, at the time.
> The Atari 400/800 computers were ahead for their time, and they should
> have taken advantage of that lead.

Hindsight is 20:20, and so are my comments. Yes they should have, as Apple
was the only other game in town (ignoring PC jr,, which tanked). In my day,
the Vic was the only serious competition when it came to purchasing
decisions, but really?

What I would have liked to have seen is a better memory system, perhaps
with the 1200XL.

Imagine the system with a 20-bit memory bus (a 1MB address space).
Split memory into 4K segments. There would be 16 registers, such that the
top 4 bits of each 16-bit address would select a segment register to use
for the top 8-bits of the effective 20-bit address. Of course, a separate
set of registers would be used for graphics memory.

A clever re-write of the OS would allow it to be mostly out of the base
64K. DOS and BASIC could be included in the OS without using much RAM.
And if the design had been in place before the 400/800 were released, the
original OS could have been laid out to accommodate the bank selecting
without breaking compatibility (putting all jump tables in the same 4K and
such).

On the hardware side, they should have come out with a PBI-based floppy
drive at the same time as the 800XL was released. Perhaps a drive with
both interfaces, so that they would only have to market one to keep
supporting older systems. (Can you boot off of the PBI? You should be
able to; where are the programming specs for that? Why isn't there a
PBI2PC instead of just SIO2PC?)

FamilyNet International Newsgate

     Well, I'm getting this announcement out half an hour before the chat. :)

     See you there at 8 pm CST at...

telnet://216.240.173.22

(Or I think it is telnet://www.atarinews.net .. or net... I use the IP address myself.)

    Instructions briefly for first timers...

type...
bbs
bbs

Next login type name and password (if you don't have one it doesn't take long to get one.)

>enter<
t (talk)
c (chat)
(enter a chat name)
You're there!

Was wondering what are the best programs on the 8-bit Atari to view
pictures such as .GIF or some of the other popular formats?

Is there one that will display Atari ST 16 color pictures or better?

Also Sound and Music files, What are the best programs to play
Sound and Music files?

Any that will play Atari ST Digitized Sound files or other Digitized Sound
formats?

I remember one that would display .GIF pictures, but it was slow and thats
been a few years ago. Hoping something better has came along.

Hi Phantom! :-)

Can't help with the sound stuff but I've heard nothing but good stuff
about this app:

Well, the obvious is to make sure the drive head is clean and that there is a
pressure pad under it.

Right, exactly what I meant. :)

It's actually even worse. Most opcodes of modern RISC processors are
tailored to some specific high-level language (of course, mostly C or C++).
The high-level language compiler can optimize way better for these
processors than a programmer can do by hand. Typically, IF more optimization
is needed, the programmer needs to only optimize one or two simple routines.
Optimizing the rest of the code by hand just doesn't weigh up against the
time it costs.

> Learning to code in ARM assembler is by no means a useless skill, as it
> is directly applicable to modern-day engineering tasks.

No, of course not, but optimizing for a RISC processor is simply more challenging than optimizing for a CISC processor. If you want to learn assembly, it's best to start with a CISC processor, learn the basics, and then step up to the RISC processor.

Hand-optimization will allways be needed, and a good programmer can probably optimize the code better than a compiler can. But hand-optimization only applies to small pieces of the code, like Interrupt Service Routines. Generally a program consists of more than just an ISR :).

And about 'RISC architecture'... Of course these days the differences between RISC and CISC are pretty muddy. A Pentium 4 processor has all the characteristics of a RISC processor, but it still has a CISC instruction set. So does the AVR. The PIC, however, has an instruction set that is really RISC. Very limited, but every instruction is executed very fast. Often you need more than one instruction to accomplish something a CISC processor does in one instruction.

AVR is indeed suited for beginners. Don't know about the MSP430. But I'd say
that the ARM is not for beginners. And I think Mark meant the ARM when he

gave his comment :).

Hmmm.

In comp.sys.apple2, somebody posted a link to this chip:
http://www.winbond-usa.com/mambo/content/view/286/523/#ProductSelectionGuide

This chip is just WAITING for a port of Contiki, I'd say :).

This is the same processor as the SNES (Super Nintendo Entertainment System)
- albeit slightly faster ;)

Regards,

Hardly. It's a masked part only (though without reading the datasheet I can guarantee that it supports external serial ROM also). This chip is intended for those multi-game TV games built into a joystick or other controller. It is a "me-too" part since Sunplus (a Winbond competitor in the toy market) had enormous success with their SNES-on-a-chip. You won't be able to buy the part at all without a quantity commitment.

Having worked with Winbond over a number of years, I can tell you their documentation will be grossly incomplete and barely comprehensible, their development system will be impossible to acquire without a personal relationship, and fiendishly difficult to use once you do manage to get it.

Dear Peter, I think you mean the i686. Look at the P4 Power-Ratings!
That Thing cannot be with RISC. Also the i586 Clone AMD XPxxxx... no
RISC.

There are some efficient Pentium available, but not the P4 :-)

(Microopcpode, ISSE3 ---- shite)

Well, the EE P4 is exceptionally. But 154W Power Consumption!?

The Pentium I use, needs about 26W and form in a line, between a
P4-2600 Standard (and XP2200), up to P4-2800 (XP-2400).
Memory latency is half as fast, as the fastest 64bit AMD Board and
faster than some Dual Channel 'DDR' 1600MHz FSB Boards (Standard 32bit).

I think time is needed, for coding RISC CpU's. The 680xx is one of the
best CISC, beside the Z80. IMHO.
Although, I would say the percentage of Programmer on this world, is
still higher with 8bit than with 16bit (also many - older
win3.11/win32s coder etc.), or 32bit. I am not talking about C+ or C++.
Milking Machine etc.

Less is more!

Best Regards,

Daniel Mandic

sigh
Here we go again.
I really wish you'd stop talking out of your backside like this, you're only making a fool out of yourself.

Pentium 4 AKA i686 *IS* very VERY similar to RISC.
It's instruction set it CISC but is based on a microcode architecture that IS RISC. You just don't program directly in microcode. The chip translates the CISC instructions into much smaller RISC steps before they get pipelined.

And power consumption has NOTHING at ALL to do with whether a CPU is CISC or RISC.

Regarding your Omniview image:

1) Atari800Win Plus' SIO Patch is not compatible with Omniview 80
Column mode. Turn the patch off.

40 Column mode is OK. HD patch is OK. P: patch.

2) Uncheck the Disable BASIC option. This is also not compatible with
Omniview as Omnimon already has a Reversed Option Key function and
Atari800Win just gets confused.

If your image does not work after applying these tips then send me an
Email. My address is easy to unmunge.

Please use the subject ATARI because email from new people usually end
up in my Junk Mail Folder.

Along with A8JDPEG (mentioned earlier), there's APACView by Jeff Potter,
which can view GIFs in various modes (including 2-, 4- and 16-greyscale modes
and 256-color APAC mode), and break GIFs into 8-, 64- and 4096-color ColorView
modes, which you can view with his ColrView app.

These days there may be some GIF decoders that can view in HIP and RIP modes, too. Not sure, though.

I stumbled across this page via Google:

  http://www.chebucto.ns.ca/Services/PDA/Atari8Viewers.shtml

Along with what I mentioned above, it also mentions AT8GIF, which I THINK might be older than APACView...? It sounds like it can only do 2- and 4-color modes.

> Is there one that will display Atari ST 16 color pictures or better?

I don't know anything about Atari ST file formats.

Of course, these days the best way to do it would be to pre-convert the files on a modern system (e.g., a Linux, Mac OS X or Windows computer) and then simply view the files on the Atari. But, if your point is to do the actual GIF or JPEG processing _on_ the Atari, this is obviously not what you're looking for. ;^)

> Also Sound and Music files, What are the best programs to play
> Sound and Music files?

There's a MOD decoder and player for the Atari, that I had fun playing with about 7 or 8 years ago. ;^) These days, people seem more interested in playing Atari songs (stored in a format playable by PCs, using the proper software, called "SAP").

I can't really say what are the /best/ programs to play music, since there are numerous apps and trackers, and I'm not musical, so haven't really played with any of them in a long, long time.

Google is your friend.

Here's one starting palce, out of many:

  http://grayscale.scene.pl/en_index.php

> Any that will play Atari ST Digitized Sound files or other Digitized Sound
> formats?

Again, I know nothing about ST formats, but along with MODs (which can include digital samples), there have been digital sound tools for the Atari since, what, the early/mid 1980s? :^) See also: Dean Garraghty. (Google is your friend :^))

> I remember one that would display .GIF pictures, but it was slow and thats

> been a few years ago. Hoping something better has came along.

Not sure anything better has come out. GIFs are so 1980s!
Where are my PNG and SVG viewers, huh!? :)

For optimization difficulty, RISC or CISC makes little difference;
superscalar or not is the big difference, and both CISC and RISC
machinese are superscalar nowadays. So even leaving branches out of
it, you have to maintain multiple parallel cycle counts. Add the fact
that memory access isn't constant (depending on cache) and you have a
real bear of a problem.

PowerPC assembler -- or ARM, for that matter, -- is much easier to
learn than x86 simply because x86 is still a 32-bit patch on a 16-bit
extension of an 8-bit machine, and its instruction set shows it. The
paucity of registers doesn't help either, though the direct-to-memory
instructions do.

>And about 'RISC architecture'... Of course these days the differences
>between RISC and CISC are pretty muddy.

About the only constant in RISC seems to be the lack of memory addressing
modes for any instructions other than loads and stores. That is, you
can't do arithmetic or branch based on a memory location.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Though I tend to agree with your conclusion about learning programming,
it is an error to think that optimization for a CISC machine is easier
than for a RISC machine.

RISC architecture was motivated by advanced compiler writers discovering
that straightforward use of CISC instructions was *not* optimal. Often,
much better speed could be achieved by ignoring the storage-to-storage
forms of CISC instructions entirely, and using, for example, register
loads and stores to move strings--not at all what the CISC architecture
suggests is appropriate.

Further, the procedure linkage instructions provided in CISC machines
were almost always either too much or too little for the job at hand
if optimality was the issue.

In virtually every case where the CISC architect had attempted to
close the mythical "semantic gap", an efficiency pitfall had been
created.

John Cocke proposed a RISC architecture precisely to regularize the
instruction set and match it to the hardware, so that an optimizer, in
generating code, would have fewer inefficient choices offered!

The demands that RISC makes of optimization is not combinatorial search
and simulation of all possible ways of doing a task, but simply the
repeated application of determinstic algorithms to allocate registers,
schedule instructions, etc.

Of course, as things have become more deeply pipelined, superscalar,
multi-level cached, etc., all machine architectures have become more
complex to program efficiently...

CISC processors have assumed the implementation character of RISC
processors, but there is still a huge difference in what can be
directly expressed in the machne language.

A CISC assembly language programmer has little recourse but to
re-compute effective addresses that the RISC programmer would have
saved in a register for re-use. And the CISC programmer will have
to allocate some variables to memory that a RISC programmer would
have kept in the register file.

These differences make a considerable difference in advanced
assembly programming on the two styles of machine.

Actually, there are very few *specific* adaptations to programming
languages in most RISC architectures. The adaptations, if any, tend
to be to specific data representations--like IEEE floating-point, or
null-terminated strings, or, occasionally, to BCD data.

RISC architectures *should* be based on dynamic frequency, not on
a catalog of "nice features", and this eliminates most of the
traditional language-specific opcodes (since every language needs
load, store, and conditional branch ;-).

Many of the "decorations" that have shown up in the last ten years
are related more to simplifying optimization and implementations
in highly superscalar, deeply pipelined machines--like predicated
execution and branch hinting.

> Typically, IF more optimization
> is needed, the programmer needs to only optimize one or two simple routines.

This, of course, is generally true, independent of architecture or
language.

They don't help if you want to go fast...you just have to find a way
to trick the CISC-to-microcode translator to do what you really want
it to do, in spite of the CISC interface. (The fact that the rules
change from generation to generation makes this quite problematic.)

>>And about 'RISC architecture'... Of course these days the differences

There are a few other things... fixed/regular instruction formats,
constant instruction execution time, large general register files,
data aligned on natural boundaries, all instructions implementable
by a simple combinatoric logic data path, etc.

You mean my Pentium is a wacky, unoptimized piece of multilevel cached
CISC (RISC). Downgraded to Milestones like 'ELITE II' or 'Tempest2000'
to see a bit of digital-art. (Not audible on actual systems)

You could easy say the RISC is better, but the time is wrong... or not?
Otherwise (meanwhile) the CISC-Base got their profits, but only to go
the way back!? hmmm. I am confused.

Best Regards,

Daniel Mandic

ATTENTION Atari customers. I'm buying out an Atari dealer, cleaning out
his ST software. Then Atari 8 Bit & Jaguar! I've paid for 80% of ST Games/
software & received 60% of ST Games/software so far! About 400 NEW Games!
If this works out I'll buy out his 8 Bit and Jaguar stock! I need to make
shelf room for NEW inventory and raise the capital to buy more Atari. If
you would like to help save Good Ataris from extinction, buy ANY Games/
Software in my Classic Atari 8 Bit and/or Atari ST Catalogs and get
20% off! E-Mail or call Ben at (503)256-9974!

http://BensCatalogs.Atari.org   WebSite & 3 NEW Atari Catalogs!
http://www.aracnet.com/~atari/specials.htm   Details on Sales!

I cut my teeth on Z80 and 6502 and found ARM one of the easiest CPUs
to learn and the easiest to hand-code and optimise.

hi everyone,
  I was wondering, did ICD ever release any of the 80 column boards
for the MIO? has anyone ever seen one of these? or was it so much more
vaporware. if it did exist then were any photos ever taken and
published? thanks.

Ken

Yes, the RISC principles provided both an implementation advantage
(simple, non-state-machine datapath) and an overall advantage in
system-level cost-performance (removal of computation from execution
time to compile time).

CISC manufacturers, who owned the market, adopted the RISC-style
datapaths to capture the implementation advantage, and abandoned
the second advantage.

Agreed! I learned 65xx machine code back in the 80's from my C=64 and
C=128... (Which my Apple II using friends kept consulting me about.) I
picked up some Atmel AVR's, and very quickly wrote assembly language
applications for my band's MIDI setup. (Metronome, channel router and
keyboard splitter are the currently used devices.) I never considered
using a C compiler or a compiled BASIC.

Thomas Richter <thor@mersenne.math.TU-Berlin.DE>:

>As for the 1200XL, it didn't have a selftest IIRC. Instead,
>this part of the ROM just shows a nice "rainbow colored"
>Atari Logo.

If you press the help key at this screen you should get the self-test.

That's why the self-test in the 800XL (and above) shows keys for F1-F4,
even though those keys don't exist in the 800XL and above.

Theres a photo of a "Star Raider" cart in "Your Atari Computer" on page 9.
I've only ever seen the "Star Raiders" cart, did they actually make one
minus the s?

Just curious..

Well, what do you know? My orginal 1979 cart is titled, "Star Raider"!
  I never noticed it's not, "Star Raiders", plural. LOL!

> -Larry
>

Hey Larry,

I've been meaning to do a mod like this for a long time and just never
quite gotten around to it. Your email got me to thinking about it again
so I tried it out. Using a 27512 with 4 ROMS burned into it in one of
my 800XL's, I was able to switch between them using switches to ground
on pins 1 and 27 (bent up) with 24K pullup resistors to pull the pins
high when a switch is open. I haven't done any extensive testing but I
was able to boot to each of the OS's

Looking at the pinouts a 272001 is pin compatible if you bend out 3 of
the pins and overhang the chip on the left side of the socket. I've
wired up a harness to connect to the last few pins on each side (1-3 and
  29-32) to a 16 position rotary switch with pullups mounted on it. I
used an 8 pin socket that I cut in half down the center to plug on to
the bent up pins of the eprom. With this I should be able to get 16 OS's
on one chip with just a single switch. I tested the harness on the
27512 and it works, so now I just have to pick out 16 OS's to burn onto
  a 272001....I'll let you know how it works.

Ah, thanks!

> I don't have a copy of the 1200xl OS ROM, but I suppose I could get one
> out
> of my 1200xl if you really wanted it.

That'd be great, if it's not too much trouble. I'd like the chance to
experiment with it a bit. Though there isn't an option in Atari800Win for
it, replacing the standard ATARIXL.ROM bios file with yours should work...

>

> Where did you find the modified Star Raiders?

Over the years I've gotten several dozen multi-game ATR files from friends
and such, and it's on one of those.

The planets on the 'takeoff/landing' screen don't move, but you're right- the placement of them are different on both. The other difference is the colors - the box pic is more blue where the actual is more yellow. Plus the pic on the box shows the landing "x" area in 2 colors (blue with yellow outlines); the release is all yellow.

The (original) First Star version used custom fonts. The Parker Brothers and Exidy versions used standard Atari fonts.

>
> Obviously, the screen on the cover does not use the Atari standard font,

That's another difference - the "Press Trigger to Continue" line never appears on that screen or durin any of the landing animations (that I know of).

Sorry, Parker Brothers.

    Wow... would like to find that copy. I am a big fan of the various
versions of Joust and Star Raiders.

The only interesting thing I could find is the following excerpt:

> Regular web browsers require several megabytes of RAM and disk space.
> The Contiki web browser only needs a few kilobytes of RAM and no disk at
> all.
> With a code footprint of 9 kilobytes and with a total of only 4 kilobytes
> of RAM
> required, it might very well be the world's smallest web browser.

This proves what I have been thinking: a CP/M Web browser is possible.

Unfortunately, I miss time and money to do one.

And, so far, each time I have not been doing something, nobody else has done it...

Yours Sincerely,
"French Luser"

I don't know about that. I was very interested when Contiki first came

out. But it seems it was going really good for a while and died. There haven't been any updates in forever. Support for most systems never got out of the testing phase. I was really anticipating good support for the C128 on the 80-column screen. I remember thinking "If only I could browse the web and do email and newsgroups on the 80-column screen of my 128, even if it were only text mode) then that would be cool. But it never happened.

Yes.. I know everbody is going to suggest that I get in there and finish the code.. Well, unfortunatly, my time is limited and I'm already working on DTV stuff too much.

Which brings me to my next thing.. The DTV is where Contiki could REALLY shine being that it comes standard with 2 MB of RAM, faster CPU, 320x200x256 graphics. If somebody wanted to spend some time coding Contiki to take advantage of all that, it would be something else. Just have to figure out the best way to network it using the user-port and best way to get a mouse working on the joystick port.

Every Sunday & Tuesday @ roughly the same time. I never make it for the
Sunday A.M. chat, but Tuesday usually kicks off between 7:00 and 8:00 P.M.
CST.

I think that 8-bit processors are not really interesting anymore. The only reason to use an 8-bit processor might be that the systems and the processor are so simple, that there is a lot of educational value. Everyone can learn to understand a computer by starting on 8-bit processors.

However 16-bit processors are much more interesting. They are hardly any more complicated than 8-bit processors, but they do offer some very interesting extra's. More processing power, more memory, divide/multiply instructions, instructions for structured ASM programming, and even memory management (although often rather crude). All that, while hardly being more complicated than an 8-bit system (software and hardware wise).

There is only one 8-bit exception. I agree with David Murray that the DTV/C-one is such an advanced 8-bit system, that it could be worthwile to port Contiki to that.

I think that maybe it might be feasible to convert the C-one's design into a 16-bit system with an 68010 processor. Imagine having a 16MHz 68010 processor with 2 SID's (stereo through a mixer), 2 enhanced VIC's (two overlayed graphics planes, like the CD-i), 16Mb memory and 16-bit peripherals! And running Contiki. That would be a system that could actually DO something worthwile, other than being educational!

Stepping up to 32-bit systems is not worthwile (for running Contiki) imo. The next step in educational value would be something like a 32-bit ARM7 processor/core. But the new Minix 3 is probably just too much for Contiki to contend with.

I'm creating a new Catalog for all my NEW in the BOX/BAG Atari Games/
Software, Hardware & Books for the 8 Bit, ST & Atari Jaguar! Below is a
sample. With a 79 Column Width! I'll be seperating all NEW in BOX to one
Catalog named NEWINBOX.TXT Each entry will be 79 columns across and should
only take one line per entry. WHAT I need to know is can your Computer and
viewing software handle Text displayed in 79 Columns? Thanx! ===Ben===

 Bravo Sierra Computers All New in the BOX/BAG Catalogs!

 Bravo Sierra Computers 16 Bit Atari ST Computer Games/SoftWare Catalog

        NIB = NEW IN BOX/BAG!

 Title (Alphabetical); Maker; Description; Type (Games, etc.); Price.

1st Mail; GST software; Mail Merge for 1st Word.;.................$20.00 U.S.
Action Fighter; SEGA Arcade Hits/Mindscape; Game.;.................$20.00 U.S.
Afrika Korps; Impressions; English/French/German/Italian. Game.;...$20.00 U.S.

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at
http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Peter, you're missing one very large element: Nostalgia. People like
to see what they're beloved 8-bit systems can do with new technology.
This was the whole basis behind the CFFA card; Richard Dryer didn't
even own a GS at the time. The Uther card was designed to be run on
8bit Apple II systems as well, unlike the LanceGS. So deeming a system
"worthwhile" to port contiki to isn't the way to go, its more the
passion of the user base.

> I think that 8-bit processors are not really interesting anymore. The only
> reason to use an 8-bit processor might be that the systems and the processor

I happen to be writing a book (my third, for what that's worth) about
how to become an embedded engineer. Here are a couple of quotes for
you:

--- 8< ---

Humor aside, it is a generally-accepted fact that the number of new
graduate engineers of all types is shrinking (at least in the United
States). Various theories are posited to explain this phenomenon. In
the specific case of embedded engineering, I see several factors
causing the decline. One such factor is the unavailability in this day
and age of well-documented home computers of the style my generation
enjoyed - Acorn BBC, Commodore VIC-20, Sinclair ZX Spectrum, and so
on. Modern personal computers are black boxes designed to run
shrinkwrapped software. They are shipped without programming tools and
with no technical documentation whatsoever. Operating system vendors
are actively working to confine software development to an exclusive
club of licensees, and lower-level development at the
direct-hardware-access layer is at best very difficult due to the
unavailability of chipset documentation (in many cases due to the
manufacturer's contractual obligations to preserve trade secret
information related to intellectual property protection mechanisms),
and the utter complexity and heterogeneity of PC hardware. In the good
old days, we could develop a homebrew program on our Commodore 64,
fine-tune it to the last instruction cycle, and show it to other people
with pride. This type of skillset is a vital component of embedded
engineering.

There are other factors that raise the bar to becoming an embedded
engineer, too - and I'll deal with them in the appropriate sections
of this book - but the point I'm making here is that it's simply more
difficult these days for kids to experiment with what they have at
home.

--- 8< ---

Intel's 8051 architecture is an industry-standard platform referenced
in almost every engineering course. When spoken of in polite company
(and even in books like this one), you'll generally see the number 8051
prefixed with the adjective "venerable". Personally, I would rather
describe it as "decrepit", but it's a solid fact that the 8051 is
still the world's best-selling microprocessor core. Barring some major
upheaval, this is likely to remain true for as long as the world is
still manufacturing and using 8-bit micros(1).

(1) - This is not quite equal to saying "forever". As die sizes
shrink, the packaging and bonding costs (bonding wires from the silicon
to pins that go out to the real world) start to dominate the cost of
the device. Raw 8-bit dice will always be cheaper than raw 32-bit dice
due to their lower transistor count, but by the time the chips are
packaged for sale, the price difference may be almost invisible. For
some applications, it is foreseeable that there will be no real cost
benefit to be realized by staying with an 8-bit architecture.

--- 8< ---

(end quotes)

As a learning platform, the 6502 is not a bad choice - it's actually a
fairly neat architecture, and there are parts based on the core still
in production. Having to work with the realtime side of a moving raster
is excellent experience for embedded design.

The 68000 (and 010) are extraordinarily inefficient CPUs by modern
standards, and complex to use and interface. There is little practical
value in learning the M68K instruction set because it's practically a
dead family.

If you intend to move up from 8 bits, it makes no sense to bother with
16 bits, you should go directly to a single-chip 32-bit ARM device.

 1) Become an engineer.
 2) Run very, very fast into a large, solid object.

Congratulations, you are now an embedded engineer.

Maybe _that's_ why I like Linux so much. Ships with GCC & friends, standard
;)

With the exception of maybe the 8-bitters, any Atari computer can
display 80 column text. Although, since you need a web browser to get
to your site, anyway, why not just do it in HTML? That way it'll format
itself to fit whatever size the web browser's window is.

>

When the Atari 400 and 800 computers were designed - I personally think
that the 400's keyboard was it's letdown. If they had the foresight
to have had that keyboard upgradeable, and to enable a cheaper 800 computer
to get to the market, more consumers would have been enticed to the
Atari Computers, rather than to Apple or Commodore, etc.
Overseas the Atari Computers were very much overpriced with an importers
markup profit added to it, which made it horribly expensive, and this
continued for some years. And only with the decline of Atari, and the
appearance of so many competiting computers, did the price finally drop
to more affordable levels. If a cheaper pricing strategy was done at the
very earliest opportunity, Atari could have developed years of dominance
before the likes of the C64, Spectrum, BBC etc appeared.

Even though I have not seen a 7800 running, I presume from what I've
seen of the emulation, that the hardware never performed as per the
advertising, and expectations, etc.
It was not up to arcade quality or anywhere near it - it wasn't even
near the Atari 400/800 standard?
I think it was the underperformance, that that was the reason it was
never released initially, at first...?

They should have realised what they had, at the time.
The Atari 400/800 computers were ahead for their time, and they should
have taken advantage of that lead.

Harvey

He is he is :-)

Phoebus

P.S. I have it on good authority that Mr. make is not *that* good of a
friend. After all GCC can do without him (crushing Messrs.
Fingers-of-both-your-hands-from-typing-24/7) most of the time. Let's
consider him as only a passing acquaintaince :-P

My grandson has begged a Atari setup. I gave him a 1200XL and
1050 with doubler and some old disks and carts.
I'm setting him up with a 1489C cable and a 486 notebook for
APE and Yogi's collection of games.
While testing out the laptop/APE, I got out my other 1200XL.
While playing some games, it wouldn't detect collisions between
players and stuff they're trying to avoid. eg. Elevator Repairman would
'BOINK' when he hits his head on an elevator. Keystone Kaper's
cop could run right thru planes and shopping carts.
Is there a possible chip that isn't working right? Or some other thing
I could replace to fix it?
Both 1200XLs keyboards didn't work so well, but I believe with a little
use they would work right.
Thanks

I don't think there ever was a disk version, it's just a dump of the cart.

Well, I guess I spoke to soon about getting the ROM out of my 1200xl. I got something, it's size is 16384 just like the others but it does not work in Atari800 running on linux, I think Atari800Win is based on the same code. It doesn't work in atari++ either.

There is some code here http://ch.twi.tudelft.nl/~sidney/atari/

that "will produce the ROM images that are byte-for-byte equal to the ones used in a wide range of Atari 8-bit hardware"

, including the 1200xl. It did produce a 1200xl ROM that ran in the atari++ emulator. PEEK(65527) does produce a 10 in the emulator, just like my real 1200xl. But, the "ROMCRC-32" utility at the same site produced different values (than my real 1200xl) while running in the emulator, with the exception of the sefltest value, that was the same.

Anyway, if you want to emulate the 1200xl I suppose you need atari++. I'll send you the working ROM by email. If you want to produce the ROMS yourself, you'll need a working cc65, or a real 1200xl.

Anyone know an easy way to dump the ROM yourself? I searched the group archives at google and used a little basic program David Firth posted, but he was talking about dumping the 800 OSA ROM. I tried to pop in the XL locations, but I have no idea what I'm doing. I think I ended up using 53151-65535. I've tried binary saves from dos, bsave from MAC/65. Probably in over my head. Just for giggles I ran strings on both ROMS and the first ten lines are identical, so I guess I'm close? It was fun trying anyway!

Here is the code David Firth posted.

```
10 OPEN #1,8,0,"D:ATARIOSA.ROM"
20 FOR I=55296 TO 65535
30 PUT #1,PEEK(I)
40 NEXT I
50 CLOSE #1
```

Well this really isn't what the thread was about, sorry folks. Maybe send me the suggestions or code by email, that would be cool.

Charlie

Well, I must of been smokin crack. I pulled a working dump. :)

All is the same in atari++ except the selftest rom!

Charlie

OK, The following is from a Newell disk, to move OS ROM to
RAM.
It seems straightforward enough, just copy all but $D000 to $D700.

I'm thinking that those addresses are for hardware chip addresses and
can't/shouldn't be accessed.
A BASIC program might go something like this.

```
10 CLOSE #1:OPEN #1,8,0,"D:OSDUMP.FLE"
20 FOR N=49152 TO 65535:REM $C000 TO $FFFF
30 IF N>=53248 AND N<=55040 THEN PUT #1,0:NEXT N:REM SKIP $D000 TO $D700
40 PUT #1,PEEK(N)
50 NEXT N
60 CLOSE #1
70 END
```

Newell's move OS to RAM M65:

```
10       .TITLE      MOVE OS TO RAM
20       .OPT OBJ
30       *=  $8000
40 START LDA #0
50       STA $022F   TURN OFF ANTIC
60       STA $D40E
70       STA $D20E   DISABLE INTRPTS
80       SEI         MAKE SURE NO
90       LDA #$C0    INTERRUPTS
0100     STA $C1     SET UP BANK AREA
0110     LDY #0
0120     STY $C0
0130 L3  LDA ($C0),Y GET ROM BYTE
0140     TAX
0150     LDA #$FE
0160     AND $D301   CLR BIT 0 TO
0170     STA $D301   BANK TO OS RAM

Well,
since Datasoft once was (and still is) one of my favourite 8bit vendors
and publishers, whatever happened to them ?? (or to Intellicreations,
since datasoft is a tm of IntelliCreations) - andreas

  ====
Hello Andreas,
Bit of a late reply, but I didn't get curious about this myself until about
now. I may have some of it wrong, as it got harder and harder to
investigate as time went on, but here is what I was able to dig up.

It appears that
Datasoft was purchased by,

Intellicreations who was eventually purchased by,
The Software Toolworks who eventually became.
Mindscape and was then known as,
The Learning Company which appears to now go by,
Selectsoft Publishing (SelectSoft is a division of MPS Multimedia)... who since 2005 has licensed some of the following well known publishers, including:

Broderbund
Activision
Capcom
Infogrames
Atari
and Hasbro Interactive

Here are a couple of links to current information:
http://en.wikipedia.org/wiki/SelectSoft_Publishing
http://www.selectsoftusa.com/
http://goliath.ecnext.com/coms2/product-compint-0000291252-page.html

MPS Multimedia Inc.
Private Company, Headquarters Location
138 West Harris Ave., South San Francisco CA 94080-5925, United States
(650)872-7100, (650)872-7133 fax, Primary SIC: Computers Peripheral Equip & Software, Primary NAICS: Computer and Computer Peripheral Equipment and Software Merchant Wholesalers
Description: Wholesale: Software distribution.

This company has been bought, sold, cheated, traded, beaten up, dumped, thrown out the gutter, cut up and spit out, and tossed too many times to count. Datasoft is hereby officially declared dead and buried. They probably had it coming too, with the way they cheated Philip Price out of his very well deserved royalties for a very good game.

Apple doesn't quite fit this picture. To paraphrase:

Modern Mac computers are white boxes designed to run preinstalled and
shrinkwrapped software. They are shipped with a DVD full of programming
tools and technical documentation (xcode, gcc etc). Additional support
is available via Apple's website. Apple are actively working to open
software development to anyone who is interested because it is in thier
financial interest to see more Mac software created. Lower-level
development isn't something that anyone should want to do except for
very small programs. Even on a Z80 programs with more than about 8K of
code soon become difficult to develop in assembler without introducing
bugs. I think the PowerPC chip set is pretty well documented, but of
course Apple is in the process of switching to Intel. At least hardware
conflicts of the type experienced by PC owners are still rare on Macs.

I know there are some people who just bought a G4 based Mac that was
replaced by a cheaper Intel based one but I'm quite happy to have a G4
system (when virus writers finally get around to attacking the Mac I
doubt they'll be doing fat binaries). However I'm still very much
attached to the idea of RISC processors, since it does make lower level
stuff easier. I hope 10 years from now when I buy my next computer
there's still a choice rather than just ubiquitous x86 boxes. Maybe
someone will have successfully revived the Amiga by then? Guess not. :(

Hi,

> Well, I guess I spoke to soon about getting the ROM out of my 1200xl. I got
> something, it's size is 16384 just like the others but it does not work in
> Atari800 running on linux, I think Atari800Win is based on the same code.
> It doesn't work in atari++ either.

If you're sure it is the right ROM image, please sent me the code and
I'll have a look on whether it is a usable ROM dump, and if it is, I'll
fixup the emulator code. It *should* work, though, because there's a
1200XL ROM support in atari++.

> There is some code here http://ch.twi.tudelft.nl/~sidney/atari/

> that "will produce the ROM images that are byte-for-byte equal to the ones
> used in a wide range of Atari 8-bit hardware"

> , including the 1200xl. It did produce a 1200xl ROM that ran in the atari++
> emulator. PEEK(65527) does produce a 10 in the emulator, just like my real
> 1200xl. But, the "ROMCRC-32" utility at the same site produced different
> values (than my real 1200xl) while running in the emulator, with the
> exception of the sefltest value, that was the same.

That depends on the options of the emulator. By default, it installs a couple
of ROM patches for the H: device and to speedup the SIO transfer. You can
disable these, though. Due to these patches, the checksums will differ. If
you want "all the original", disable the SIO patch and the H: device handler
and you should be fine.

> Anyone know an easy way to dump the ROM yourself? I searched the group
> archives at google and used a little basic program David Firth posted, but
> he was talking about dumping the 800 OSA ROM. I tried to pop in the XL
> locations, but I have no idea what I'm doing. I think I ended up using

> 53151-65535. I've tried binary saves from dos, bsave from MAC/65. Probably
> in over my head. Just for giggles I ran strings on both ROMS and the first
> ten lines are identical, so I guess I'm close? It was fun trying anyway!

It's not that easy. With the standard DOS (2.0S at least), you cannot save
ROMs to disk with BSAVE. Furthermore, you won't be able to save the selftest
ROM like this. You first need to enable the selftest, then dump manually
the lower Os area, 0xc000 to 0xcfff, then the selftest, then the upper Os
area, in that order.

> 10 OPEN #1,8,0,"D:ATARIOSA.ROM"
> 20 FOR I=55296 TO 65535
> 30 PUT #1,PEEK(I)
> 40 NEXT I
> 50 CLOSE #1

No, that's only the upper Os area. Enough for Os/A and Os/B, but not for
the XL series.

So long,
     Thomas

Hi,

> It seems straightforward enough, just copy all but $D000 to $D700.
> I'm thinking that those addresses are for hardware chip addresses and
> can't/shouldn't be accessed.

Sure they can be accessed, and they should be dumped. It's the selftest

in that region. It's just not visible there because it is banked in
elsewhere when enabled.

So long,
     Thomas

> Peter, you're missing one very large element: Nostalgia.

Hmm, nostalgia for me means that I like to have those old computers as
original as possible. So running Contiki on a C64 does nothing for my
feelings of nostalgia. Running GEOS on a C64, however, is a whole different
thing.

You have hit the target straight in the center with your conclusions. I have
nothing more to add :).

> The 68000 (and 010) are extraordinarily inefficient CPUs by modern
> standards, and complex to use and interface. There is little practical
> value in learning the M68K instruction set because it's practically a
> dead family.

Sadly the instruction set is a dead family. But it's NOT complex to use and
interface, on the contrary. Maybe you only have experience with a Commodore
Amiga, which does have a fairly complicated architecture. But if you look at
simple 68000 designs, they are not much different from the older designs
around 8-bit computers. An 8088 is much harder to interface, with all those
stupid clock phases and it's silly memory map.

I have played that game on my 400, XL and XE with no problems what so ever. To
me it ran good on all three.

I think Contiki definetly helps the 8-bit, but to me my 8-bit systems will never die. I use and love them just as much now as I did when I first got them. Others may think differently.

I've been working with Coldfire a lot of late. Using assembler on it is like a
time warp back to when I was using the 68K family back in the late '80s.

Since Palm went to ARM, ColdFire is more or less a dead end, IMHO.

No I wasn't sure at this point I had anything right.

Ah. I dont know why I couldnt get anything to work the other night. I just
tried again and the 1200xl ROM from the atarirom package works even in
Atari800. My dump works too. I disabled the patches and now the ROMCRC-32
checksums are identical to that on the authors page. Thanks!

I really didnt think it was that easy, but what the hey it was worth a shot.
Funny thing is even doing it this way I got a working dump, at least enough
to get sparta rollin and run the crc util. But I really would like to make
my own proper ROM, so I'll give this a shot, thanks again.

I recall just accessing some $D000 addresses will cause bank switching.
The selftest vector is at $E471, which in my 1200XL is a JMP $FCE1.
So, I don't think self test is in $D000-$D700. I still think this area
requires some special handling. $D000-$D0FF is GTIA, $D100-$D1FF
are unused, $D200-$D2FF is POKEY, $D300-$D3FF PIA (PORTB,A),
$D400-$D5FF Antic, $D600--$D7FF unused, not empty, $D800-$FFFF
10K OS ROM.

I agree. Me too! AOL! Or whatever.

Although I've been working with Contiki, which is a cool project but
nothing that nostalgic people will reflect over. Maybe enthusiasts
who have wired their own network card but lacks an OS to run it with.

(quite a bit of cross-post, and still several relevant groups are
 missing)

What I liked about the M68K instruction set is the way it still was tailored
to handcoded assembly programmers. The Commodore Amiga became a success
because all the C64 6510 hand coders got a processor which was easier to
code for, was faster, and more versatile too.

The 8088 on the other hand had such an ugly instruction set that it was
shunned for years by the people who matter :D. Thats the main reason why the
PC had so few games in the 80's. Only with the 80486 Intel's instruction set
was cleaned up so much that I would dare to hand-code assembly for it. And
that really means I will *never* hand-code assembly programs for it *ever*,
as today's programming tools are so much better and the processors are so
much faster.

The ARM is a RISC processor, and RISC processors are not really suitable to
hand-coding. Assembly code for a RISC processor needs to be optimized to
have it make use of all the advanced features. Unoptimized code is often
slower than unoptimized code of CISC processor, while optimized code may run
MUCH faster than optimized code of a CISC processor.

So stepping over to ARM and hand-coding for it to learn about assembly
language is not very efficient. Better to start on the M68K and then going
on to ARM. Things like 'pipeline' and 'branch prediction' will be a lot
easier to understand for a student.

Did you know, by the way, that the 6502 processor (or at least the 65xx
family) is the worlds first microprocessor to have a pipeline (or so I was
told at school)?

Anyone using the Contiki web browser? What hardware/settings do you use? I have a 130XE connected to a P/R connect and a Lantronix UDS-10 and ethernet/cable network.

TIA,
Joe

Actually the ARM is the RISC micro you're most likely to need to
hand-optimize. Writing high-performance ARM code, especially when
interrupt latency is a problem, involves dancing between 32-bit and
Thumb modes, and _very_ careful juggling with register usage.

I remember the XL/XE self test is a bank switch area in lower
memory. In XL/XE the self-test code is at $5000 and is bank switched
enabled when PORTB bit 7 is 0ed. So, there's OS ROM at $5000, how
do you handle that in a ROM dump? The code is from $5000-$57FF.
This is a bank switching function. I think the code that 1200XL jumps
to in upper $Exxx ROM does the bank switching and jumps to the
$5000 code.
Sorry if I'm confused. Just trying to figure how to make a
good dump of 1200XL ROM.

The point is really that the selftest *IS* at 0xd000 to 0xd7ff, just
that it is not visible there unless mapped in. And if mapped in,
it appears at 0x5000.

Thus, to make a good dump, first

i) Loop over 0xc000 to 0xcfff, dump bytes there,
ii) map in the selftest by setting bit 7 of 0xd301 to zero
iii) dump the area from 0x5000 to 0x57ff
iv) disable the selftest
v) dump the area from 0xd800 to 0xffff

The problematic part of all this might be that 0x5000 might or
might not be part of the RAM your basic program occupies. Thus,
your program should rather be short. The resulting binary is
really how the bytes are arranged in the ROM, in that order.
As you see, the "ROM hole" from 0xd000 to 0xd7ff fits nicely
into the selftest area 0x5000 to 0x57ff.

As for the 1200XL, it didn't have a selftest IIRC. Instead,
this part of the ROM just shows a nice "rainbow colored"
Atari Logo.

So long,
     Thomas

OK, I don't think a small BASIC program would interfere with $5000.

I see how to dump a 800XL 130XE that have the self test now.
I don't think the 1200XL has the banking tho. The pointer to
where to do the self test (BYE in BASIC) is at $E471 and in

the 1200XL JMPs to FCE1, I think there's enough room for the
rainbow logo there without the bank switching.
In a Omnimon $E471 JMPs to $F2C9 and in my 800XL JMPs
to $F223.
If 1200XL doesn't do the switching, then just a dump from $C000
to $FFFF should work.

Most processors are going to benefit from a bit of hand-coded assembly in an
ISR, so your point is moot.

What Peter was getting at is that writing hand-optimised assembler is an art
form at the best of times, and doubly so an a RISC architecture. Someone
cutting their teeth on assembler is much better off on a CISC than worrying
about the branch pipelines and shuffling data between 128 registers...

Not at all. ARM is particularly challenged w.r.t interrupt latency, so it requires careful tweaking. It is also possibly the most broadly used 32-bit core, by which I mean it is found in big devices that are microprocessors, and small devices that are microcontrollers with no external memory bus and say 32K of internal flash/2K internal RAM.

These tiny ARM devices are being positioned to replace 8-bit devices in a large number of low-level control applications, many of which are not coded in C.

Learning to code in ARM assembler is by no means a useless skill, as it is directly applicable to modern-day engineering tasks.

AVR is a RISC architecture too, albeit an 8-bit one. Ditto MSP430 (16-bit RISC). Nobody would suggest that it is silly to learn these assembly languages.

Silly? Of course not! The best for a newbie? IMHO - not!

Regards,

?!! AVR is ROUTINELY used in introductory-level educational courses
(assembly language).

I've been playing with my Atari's again.

Basic Stock 800xl, homemade ape cable, AtariSIO/linux, Spartados 3.2g

So I've been able to run bug65 under sparta, but not today.

The only thing I changed was turning off the tdline!

That was it, turn tdline on, bug65 works. Turn it off, it will not run.

Anyway, thought that was kinda funny...

Charlie

>From a NOOBs point of view...

Soldering is easy... desoldering is not.

The Wizztronics can be simple and it can be a pain in the butt.

Depending on your 800XL you might have to desolder one 74LS158 and
solder in a socket.

Also, if you have the CO12296 ANTIC then you need two additional chips,
plus you have to desolder 30 holes on the Wizztronics board before you
can insert the new additional chips.

It was not a good first project for this particular NOOB.

- Steve Sheppard

Looking at the circuit diagram:
http://homepage.ntlworld.com/kryten_droid/Atari/800XL/800XLF/800XLF.htm
the keys you mention all use pin 1 of the keyboard connector.
This goes to the signal OUT1 from RN1 from pin 14 of a 4051 chip.

If I were your I would look for a dry/broken joint somewhere between those two points.

I doubt it is an ANTIC fault.

Does anyone out there have a working ROM image of the Omniview XL OS? My real 130XE which contains a Ramrod board with Omnimon and Omniview died (probably bad RAM from the looks), so I don't have a way to make my own image right now for use with Atari800Win+. I've done some searches with XL Search, but non of the files listed are either reachable or have a valid 16K image that works (though I did find one for Omnimon there).

Thanks.

Jason Harmon

Bradley at Best sells the Wizztronics assembled. Which makes it a *BIT*
easier to install.

The assembled one is what I bought but I needed the extra chips...I
botched desoldering part.

It sits waiting for me to buy proper desoldering tools. I desoldering
bulb isn't good enough.

It's great to see another board back up. I couldn't log in under port
8888 though. Your main board looked cool though, and was extremely
fast - much better than the 300/1200 baud I originally did on my
Atari.

Yeah I think the Cafe' might be down tonight. If it doesn't reset on the
hour i'll have to jaunt up to the office and see what's going on.

Thomas

P.S. Thanks for the kind words ;)

Ok, I recently installed a MyIDE kit in my 130XE and I am loving every
second of it. Now that I have a fast as hell method of booting my Atari, I
intend to use TBXL a lot more often. However, I have a question...

While it's not too much of a hassle, I'm not overly fond of having to load
and reload TBXL from scratch every time I go to DOS and want to return to
BASIC..

The question I have is if any of you guys know it's entry point so I could
just run it straight from DOS without having to completely reload it?

I ran the file through DIS6502 and didn't have much luck determining a safe JMP point. While I haven't done it, yet, I am about to decode the file header and find out what bytes #3 and 4 point to. I believe they will point to $02E7, but all that gets me is a system hang.

If I could get around this little annoyance, I'd probably remove my BASIC chip altogether. :)

Thanks,
--

Thanks for your help.

This is the one version that I found on XL Search. The Omnimon ROM seems to
work fine, however the Omniview ROM in the ZIP (hires.rom I assume), does
not seem to work correctly. First the GR.0 text is a modified char set,
which Omniview did not have. More importantly, calling the entry point to
80 column mode (X=USR(49152)), crashes Atari800WinPlus and does not work.

Thanks.

Actually, a desolder bulb works quite well even on the atari boards.
just dont be afraid to get it real close to the iron when ready to
pull the solder, thats why the tips are replaceable (1 of the reasons
anyway). I used bulbs and solder pullers a long time before I got my
pace station.

Ken

PS: I'll help you if you need it.

look at the last few bytes in the file to find what address is loaded
into $02E7 and that is the address you need to jump to. Unless tbxl
does some odd things when it starts then that should work. also, that
wont work if you have done some DOS command like copy, that wipes out
program data. hth

Dave.
There are several incarnations of Frank Ostrowski's Turbo BASIC.
Apparently you are using a .EXE/.COM/.OBJ binary loading version.
The original TB was a DOS 2.5 boot disk, autorun.sys, and it uses RAM under the OS at
$C000 and above. I think it even moves the ROM into RAM.
I know Tom Hunt made a version that would work with SpartaDOS, I think I know.
Since you're using MyIDE, then you also are using a custom ROM, that probably
replaces the OS into RAM.
I guess I'm forgetting what I'm trying to ask.
What OS, DOS and TB versions are you using? You obviously have an IDE hard drive.
Are you booting from the hard drive and loading TB from that?
I think Tom Hunt's TB version is called Fast BASIC or something like that.

Very confusing post about a problem that should be fixed by spraying
the drive selector switch with some Tuner Cleaner or Contact Cleaner
from Radio Shack.

I haven't yet checked this out, but for those who use Unix-like systems
(such as Linux), there's an X-based game based on the original 8-bit
Archon:

http://xarchon.seul.org

It's pretty close to the original and so is rather primitive by today's
standards, but if you still like "old-style" games, it's worth checking
out.

There was also the 1993 Archon Ultra for DOS. I've still got that (and the
original), but I haven't played it in a while.

Hello All,

This week (until 3 February 2006) I will be offering the DGS Atari 8-bit CD-ROM (commercial and PD combo) for the special price of $7 (2.50pounds for UK buyers), which is a $3 saving on the usual price. This price includes Airmail shipping to any country (first class post for UK buyers).

If you don't already know, the CD contains most of the DGS commercial Atari 8-bit products and the full DGS PD library (191 double sided disks). The commercial products include the PPP products QUICK programming language, SAM 80-col GUI (no extra hardware required), and games, along with the Digi-Studio digitized music package, all 26 issues of the DGS newsletter, and more. All products are in both DCM and ATR format, and have PDF versions of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

There's plenty of background info on DGS on the main part of the website.

Dean Garraghty

Hi David-
I hate to be a wet blanket, but this has been looked at several times, and there just does not seem to be a straight-forward to do what you want. It was for that reason that the author included all the regular Dos functions internal to TB. I *think* the major problem is the use of the ram-under-rom. If you exit to Dos, I'm pretty sure you wipe this out, and reloading seem to be the only way to get it back. Fortunately with a HD, the load time is minimal. Here are some vectors for you to explore:

$000C $2080 Dosini

$C060 Program Init, pointed to by $02E2, $02E3 (Ram under Rom address?)
$12EA Program Run, pointed to by $02E0, $02E1 (Right in the middle of Dos?)

If you execute the Dosini address (jump through it) you will get the TURBO prompt, but you'll find the machine locked up.

I'm not sure about the TB cart. IIRC, you can't get back with your program intact, but you *may* be able to get back to TB by pressing RESET from the Dos menu. Alternatively, you can copy the Turbo Basic XL file to a suitable ramdisk, and then reload when exiting Dos -- almost instantaneous, but of course, your Basic program is gone. I'm quite sure in my "Floppy Days" that I automatically copied TURBOBAS.COM at boot-time. (Used a program from Analog, IIRC.)

If you do find a way around this, do let us know. This has been a (small) thorn in our side since TB first appeared.
-Larry

$2080 is the correct address, but you'll have to patch your DOS:
Change the "run cartridge" command so that it does a "JMP $2080"
instead of "JMP ($BFFA)".

Running $2080 directly from DOS could (at least in theory) also
work, but only if the DOS loads the MEM.SAV file before starting
the program. IIRC most DOSes only load the MEM.SAV file when
you use the "run cartridge" command

I have been using TurboDOS which supports the fine "BAC" command.
Just enter "BAC 2080" once, then write the DOS files to disk and
now you can go back from DOS to TurboBasic by simply typing "CAR".

so long,

Hias

Ok, so I'm using MyDOS 4.53/4 and Mr. Atari's MyIDE, and the one thing that has drivin me up the wall is how to get MyDOS to use the extra 64K as a RAMdisk.

I've looked into several methods, and so far, the ones I have looked at just don't work. I suspect it may be an issue between the RAMdisk utility and the MyIDE ROM OS, but I'm not certain.

Has anyone else racked their brain against this one and come up with an answer?

Well, I'm not normally one to reply to my own post, but I stumbled across
"Atari Ramdrive 1.0", but the links to their files are bad. However, I found
it on XL Search. About to try it now. Alas, it doesn't work with TBXL, but I
can deal with that...

Thanks to those who offered to help but I'll get around to fixing
it...eventually.

The big problem was my impatience. I didn't have so much as a
desoldering bulb so I tried to desolder by wicking with stranded wire.
Didn't do a very good job of it and I couldn't fully insert the IC. I
figured it was good enough and started soldering. That's when I really
ran into trouble. As I applied the solder (from the underside) the IC
wicked it up the legs, right through through the holes. Before I
realized what was happening two or three pins drew up way to much
solder.

Now I can't seem to get the IC out. I eventually did buy a de-soldering
bulb but that hasn't helped because of the mess I created on the top
side of the board. I also burned the board and caused some of the

tracings to de-laminate.

That's how much damage newbie can do! LOL!

There are a number of RAMDisk programs.
I think you have a 128K 130XE, since you
have 64K to dedicate to a ramdisk. You're using MyDOS 4.53 and want to use
TBXL also.
And you have MyIDE OS and interface (cart
port I guess.) with a large (for Atari) 3.5"
hard drive.   ??

RAMdisk. <

You don't say if you have tried the "stock" MyDos ramdisk --
ramboot.aut (or whatever it's called under 4.53/4). Must be renamed
.AR1 IIRC. You have to set it up with the "O" command -- did you try
this? (And after using the "O" command you must write the modified Dos
files to save that configuration.) Does your XE pass the diagnostic
memory test for its extended banks?

No, my MyIDE interface is the internal "MyIDE-XE" kit (which was somewhat annoying to install).

System is...

130XE with MyIDE w/ 20GB (it's the smallest one I have!) 3.5" hard drive, video circuit repair/upgrade, and stock 128K RAM.

As for using TBXL with a ramdisk, that's not that big a deal. What I need the RAMDisk for is to circumvent the bug in the MyIDE that corrupts HDD data when copying directly from, say, the partition assigned to D2 to the partition assigned to D1. That's all, really.

Before I got the MyIDE, I only used DOS 2.5 with my 1050s. And briefly used "OS/A+" or whatever the hell it was that came with my Astra 1620 (I got it at a yard sale for 5 bucks, it promptly went in the trash. I hated the drive and it's DOS). I LOVED the almost instant load of the DUP from the RAMDISK with DOS 2.5. Now that I have the MyIDE, it has, at most, about 1 second longer load time.

2006.01.12 MicroUSB.org, USBDOS 0.1
2006.01.06 added: Cosine Systems (CGM UKScene Radio Intro, 1K Party, Reaxion)
2006.01.06 Petr Stehlik, Atari800 v2.0.1
2006.01.04 added: Soudi (makeATR v0.06)
2005.12.31 Piotr Fusik, ASAP 0.1.0 (Another Slight Atari Player)
2005.12.31 Radek Sterba, Raster Music Tracker (RMT) 1.22
2005.12.30 MicroUSB.org, USB Enduser Driver Disk USBTEST Version 0.6
2005.12.30 BAKTRA, TURGEN SYSTEM 2 and other updates
2005.12.19 Draco, KMK/JZ IDE BIOS 1.10, FDISK II v.2.3, Diag v.1.2
2005.12.19 MadTeam, Mad-Assembler (MADS) 1.6.8, Graph2Font 3.8.4.0
2005.11.27 added: Freddy Offenga (rominfo)

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

God, I'm such a dumbass... That did the trick. I didn't know the RAMdisk
config was part of that. Like I said, I'm a MyDOS noob...

And, yes, my 130XE *would* pass the memory diag if I still had the Atari OS.
It's been replaced with the MyIDE OS, and with it, "BYE" coldstarts the
atari.

Thanks! :)

> If you execute the Dosini address (jump through it) you will get the
> TURBO prompt, but you'll find the machine locked up.

Not necessarely. The problem is not the RAM under ROM. The problem is
that the Dos will overlay the *regular* RAM part of TurboBasic with its
own data. Which kind of data is placed there, or whether data is placed
there depends on the Os.

For the Atari Dos'es (2.0S, 2.5) the DUP.SYS is loaded there and thus
breaks Turbo Basic. For OS A/+ and related (including my own Dos 2.XA/XL)
the command line propt is part of the resident DOS.SYS and thus *these*
DOS'es will allow to return to TurboBasic savely - *all provided* that
the command line doesn't require the memory for its own. This happens
for example for Dos Os/A+ and my 2.XA/XL series whenever you copy a file -
namely to keep the file contents, or if you load a binary file ontop of
Turbo Basic (quite naturally).

The solution to your problem is thus to use a different DOS, or not
to use the DUP.SYS. Then, returning to TB is really "RUN 2080".

Greetings,
     Thomas

Hi-
Perhaps things have changed, but previously only version 3.3a of Sparta
would work with the MyIDE and it's OS rom.
Can TurboDos (or other) CLI-type Dos work with the MyIDE now? If the
problem is overwriting lower memory by DUP.SYS, then shouldn't using
MEM.SAVE with an Atari-type Dos work? I'm pretty sure that I tried
that some time ago and it didn't, but I'll try again. I am interested
in this issue!

I don't know.

> If the problem is overwriting lower memory by DUP.SYS, then shouldn't using
> MEM.SAVE with an Atari-type Dos work?

In principle, yes. However, MEM.SAV is typically only restored on the
"B"ack to Cartridge command, and not on the "G"o to hex addr command which
is required to restart TurboBasic. Thus, it doesn't work without
modifications on the DUP. See also Hias posting on this.

So long,
     Thomas

Many years ago I managed to get this working using DOS 2.5, I wrote a
small program that would modify DOS 2.5 to allow you to go back to TB
by selecting the 'B' option from the DOS menu.

Several years later New Atari User/Page 6 published the program. I've
been looking for the issue it got published in, but I've not been able
to find it. It's in one of the later issues, certainly after issue 61.
Unfortunately the online Page 6 archive hasn't got that far yet.

I should still have a copy of the file and/or binary on a floppy
somewhere, I could try to find that if any one is interested.

I'll try to make this short (doubtful, LOL).

I've built 3 versions (same hardware just different wiring) of internal cartridges using SRAM. The project is basically a subset and variation of Bob Woolley's SmartOS.

All three configurations suffer from the same problem. I can store cartridge images in battery backed up SRAM but when I shut down the 800XL and power up I boot to black screen. The only way I can start the cartridge is by holding down the Reset button for approximated 7 seconds.

The hardware consists of not much more than one 32K x 8 SRAM which sits in the socket formerly reserved for the BASIC ROM. I do use two additional sockets as adapters so I can re-route or utilize A13 (for an addition 8K bank), A11 (because A11 from the BASIC socket is the pin normally reserved for /CS), Vcc, /OE, /WE (R/-W in A8 schematics), and eventually A14 will be used (for multiple carts). Borrowing from Mr. Woolley's followup article, SmartIDE for the 1200XL, I used the Dallas DS1210 SRAM controller (for the battery backup).

The three configurations.

1) Substituted SRAM for the 800XL internal BASIC ROM. No gates were used in first trial. /OE is enabled (fixed to ground), -BASIC signal to /CS (thru the battery backup circuit), R/-W signals /WE on the SRAM (I also have a switch to write protect)

I use my own software (simple Action code) to load the SRAM. I switch on write protect and initiate jump to the Coldstart vector. The

cartridge then runs (or it doesn't).

On this trial, in addition to having the initial black screen problem on about 50% of the cart images worked. The others refused to revive from the black screen. Please note that I can turn of power and still revive the cartridge, with the Reset trick mentioned above.

2) Moved on to simulating external 8K cartridges. Instead of using -BASIC for chip selection I use -S5, just as an 8K cartridge does. To indicate the presence of an 8K cartridge I tied RD5 to Vcc. These are the only hardware changes from stage 1.

The software was changed because for a simulate external cartridge I could perform direct writes to address $A000-$BFFF. I didn't have to bank select the "BASIC ROM" as I had in stage 1.

Despite being basically the same hardware about 75% (vs 50%) of the cart images run but several have visual problems.

3) 16K cart emulation. Tied both RD4 and RD5 to Vcc, -S4 is connected to A13 of my SRAM to control two 8K banks. Used -S4 and -S5 thru an AND gate to signal chip select (if either is LOW then the SRAM gets selected).

I had big problems here. Only about 10% of the ROM images would run and nearly all of those were corrupted.

I eventually incorporated 02 (Phi2), I believe correctly or as per Bob Wolley's intent (but I'm no electronics guru, not even close, LOL). To be honest though, I don't understand how or for what the 02 clock signal is used in this application.

Eventually, I fixed many of my problems and am working on the others but the boot up isssue keeps nagging at me.

Here are my questions for the group.

Does the OS detect a cartridge, external cart or built-in BASIC, in some way that I am not aware of? My SRAM is write protected, AFAIIK the hardware should see the SRAM as ROM.

I'm aware that OS checks a zero value at $BFFC, and if it finds it then the OS assumes that $A000-$BFFF is RAM. I don't know if the OS tries to write to that range at this time. In any case, the SRAM is write protected via a switch.

Could there be timing issues, as in the SRAM responding initially too slowly or too quickly?

   Well, I tried running WinApe on the Dual 800 mhz G4 Mac. Had all loaded,
but couldn't get it to work with the serial to USB adaptor.

    But I have heard of it working.

    However, I have SIO2OSX working now, and it is a good virtual drive system.
  Has bugs but the developer is busy working those out actively. :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

RELATED NEWSGROUPS:

Perhaps a dumb question, but did you email Brad to ask? I was actually
about to do that myself.

Hi Raphael-

> Many years ago I managed to get this working using DOS 2.5, I wrote a
small program that would modify DOS 2.5 to allow you to go back to TB
by selecting the 'B' option from the DOS menu.

Several years later New Atari User/Page 6 published the program. I've
been looking for the issue it got published in, but I've not been able
to find it. It's in one of the later issues, certainly after issue 61.
Unfortunately the online Page 6 archive hasn't got that far yet. <

That would be great! I'll also look in my Page 6/NAU mags. -- I have
them until the end of publication.

-Larry

which
is required to restart TurboBasic. Thus, it doesn't work without
modifications on the DUP. See also Hias posting on this. <

Yes, you and Hias are quite correct. (Years ago,) I used the
disk-based version of Atari Microsoft BASIC for quite some time, and
knew that I used MEM.SAVE with it. It appears Atari had patched Dos
2.0s to do as you both suggest. -Larry

Hmm, but TB XL is not looking for values at
$0E-$0F, $6A, $80-$81 and $02e4-$02E8 ?
If you need ALL memory then nothing you can do,
but if you don't then you can do it without modyfing DUP.SYS,
just there will be less memory. I don't know TB XL,
but I just think it is compatible with ATARI BASIC in that
one particular thing ?

Sc0rpi0
I hated going to weddings.
All the grandmas would poke me saying "You're next".
They stopped that when I started doing it to them at funerals.

Well i've searched high and low, and I have done the SuperVideo upgrade, but
for the life of me I can't find any documentation on adding the Chroma line.
I hooked this thing up to a proper cable only to find this particular 130XE
doesn't appear to have Chroma. Any help is appreciated!

I'm beginning to think Q2 is burned out as it is responsible for Chroma
output. Will let everyone know.

BTW anyone work with MyIDE 4.2 yet? I have some programs that SEEM to not
run now. Could be something else.

Here is a short intro and overview to Reanimator II, this months prize game on The DarkForce! BBS. You'll have to play often to win! :-)

R e a n i m a t o r

... how did you get here? You can't remember for sure. All you can remember are the sounds... the music of the spheres. You sense that you were cast into this darkness by powerful hands... hands that control your destiny... of someone with a power that you cannot imagine.

You feel a strange surge within you, and you know you have changed somehow... and you suddenly notice the book in your hands. You open it to find spells of which you know nothing... conjurations of the spirits... and the power to reanimate!

Then your become aware of one more thing -- you are not alone... and from the constant probings within your mind, you doubt that they are friendly.

One voice comes thru louder than the rest... it is the voice that belongs to the powerful hands... "Destroy all others!"
"By Enlil, I command thee!!"

In Reanimator,you become a Necromancer at war with other Necromancers. You must maintain a mighty army of undead soldiers in order to prevent other Necromancers from dueling (using powerful spells) against you.

At the same time, you must increase your magical energy, strength, and endurance in order to perform your varied options -- among them is the opportunity to attack other Necromancers. Other choices include the reanimation of the dead to create reinforcements, sending out zombies on search missions (who knows what they will come back with), drinking magical potions, and praying to your gods.

You will need your staff to cast those spells, so hang on tight! Other magical items in your possession are the powerstone (used for storing energy that cannot be lost as long as you are alive), and a crystal ball (used to spy on other Necromancers).

The top _surviving_ reanimator will each month be added to the Hall of
Fame. Will your name be written there, N e c r o m a n c e r ?

Good luck all! :-)

I took the CF card and placed it in the 800XE laptop, which is running 3.1
and it came up. The program I am testing with is a binary file of
Montezuma's Revenge.

Also once on the 4.2 I received an error 135 when trying to load this
program.

What are our options for an 8-bit IRC client?
